REQUEST FOR PROPOSALS

PROPERTY ACQUISITION AND SITE DEVELOPMENT FORMER WASTEWATER TREATMENT FACILITY SARL DRIVE (FORMERLY 346 SOUTH BROADWAY) SALEM NH

1. Introduction

The Town of Salem NH is currently accepting proposals for the acquisition and development of a 32 acre parcel of land located on Sarl Drive - formerly 346 South Broadway. The parcel is the site of the former Wastewater Treatment Facility and is currently under an environmental/groundwater management permit, NHDES #198405033, HAZARDOUS WASTE PROJECT #00091. The Town has identified areas of soil/groundwater contamination and has advanced a Remedial Action Plan notwithstanding all physical structures have been demolished and abated. At this time the Town is seeking developers experienced with hazardous waste site cleanup that may be able to leverage the contamination costs through grants and assistance and ensure an economically vibrant repurposing of the property.

Notice of this RFQ will published the week of December 27, 2021, in the following newspapers: Lawrence Eagle Tribune (weekly daily newspaper covering the Merrimack Valley and Essex County, Massachusetts, and southern New Hampshire), Union Leader (weekly daily newspaper of Manchester NH and covering southern New Hampshire), and the Portsmouth Herald (six-day daily newspaper serving greater Portsmouth New Hampshire), Boston Globe, Boston Herald, and the Town website:

Current Bids, Proposals and Awards | Salem NH (townofsalemnh.org)

All proposals must be received physically by February 25, 2022, at 2:00 PM delivered to 33 Geremonty Drive, Salem NH, 03079. A site visit will be conducted on January 19, 2022, at 10AM.

The Town of Salem NH reserves the right to accept any proposal, reject any proposal, or waive irregularities for any reason or no reason at all. The Town of Salem NH also reserves the right to accept an offer for all of the parcel, a portion of it through subdivision, or none at all, and other considerations as in the best interest of the Town through the Board of Selectmen.

2. Background

The Town constructed the WWTF at the Site in 1964. Prior to that time, the Site appeared to have been used for agricultural purposes. Expansions of the WWTF were completed in 1972 and 1973 with the addition of filters and digesters. All the WWTF structures were abated and demolished between 2017 and 2021 by the Town. The WWTF operated until 1986, when the sewer main was constructed to

connect the Salem sewer system to the Greater Lawrence Sanitary District.

The site is accessed via SARL Drive that extends from South Broadway to the northeastern portion of the site, and via Garabedian Drive from the south. The site was formerly known as 346 South Broadway (NH Route 28), in Salem, New Hampshire. The site is approximately 32 acres in size and is comprised of two parcels identified as Lot 9475 on the Salem's Tax Parcel Maps 136 and 143. The location of the site in relation to South Broadway (NH Route 28) and the surrounding area is shown in Appendix C. The northern portion of the site is currently occupied by the Salem Animal Rescue League which operates out of several temporary buildings and is under a License Agreement until January 29, 2023 (Appendix D). The Spicket River forms the western and northern boundaries of the site, and portions of the site are located within the 100-year floodplain of the river. Wetlands are located adjacent to the Spicket River, and the remainder of the site is largely wooded, with some areas of open fields that are mowed by the Town. A survey was conducted at the site in 2018 and is listed in Appendix E. A fence is also located at the end of Garabedian Drive to restrict access to the site from the south.

Infrastructure for developing the parcel currently in place includes:

- Water – 6" stub from 12" distribution main on South Broadway via Sarl Drive
  12" distribution main available via Garabedian Drive
- Sewer – 30" main entering property via Sarl Drive from South Broadway
  30" to 42" on property exiting via Garabedian Drive
- Electricity – Liberty Utilities Power Station abutting northeast corner of property, opposite Spicket River, on Duffy Avenue (denoted by red star in Appendix A map)

Other utilities exist in close proximity to the parcel and could be accessed readily notwithstanding the site is located in the Garabedian Drive Economic Revitalization Zone (Appendix F).

The facility was taken offline in 1986 and during excavation for the sewer bypass line at the site in 1986, contamination was encountered. According to a summary of a March 1986 notification report to the New Hampshire Department of Environmental Services (NHDES), a strong chemical odor, dark gray soils, and groundwater with brown foam were observed during excavation. Following discovery of the contamination, numerous investigations were completed and in 1993, NHDES issued a GMP to manage impacted groundwater at the site. The Town has set a goal to reach final cleanup on the property by 2022 and bids were received in early 2021 for Thermal Remediation of Volatile Organic Compounds via the Pre-Design Investigation Summary Report, Remedial Action Plan Addendum (October 23, 2020) and hereto attached in Appendix G.

3. Submission Deadline and Instructions

Interested Party's (IP) are requested to submit proposals clearly marked **"RFP 2021-027 PROPERTY ACQUISITION AND SITE DEVELOPMENT"** with the IP's name and address on the front. One (1) signed original hard copy, five (5) separate hard copies, and one (1) electronic copy (in PDF format on a portable USB flash drive) of the proposal shall be submitted in a secure package. **Proposals submitted by fax or email will not be considered**.

IP's must also execute and include in the sealed submission (including bid and acknowledgements), the Non-Collusion Statement, Signed Addendum (if applicable), and the Tax Certificate W-9 form. All proposals become the property of the Town of which has the right to disclose information contained in the proposals once awards have been made.

All outer envelopes/packages must be labeled **"RFP 2021-027 PROPERTY ACQUISITION AND SITE DEVELOPMENT"** with the IP's name and address on the front, addressed to:

Gia Faccadio – Purchasing Agent
Salem Town Hall
33 Geremonty Drive
Salem, NH 03079

No proposals will be accepted after the time and date noted: February 25, 2022, at 2:00PM. Late delivery of materials due to any type of delivery system issue shall be cause for rejection. Proposals must be signed through the Cover letter - Section 4(IV)(A) by the individual, partner, or designated representative for the IP who is authorized to enter into contracts. Proposals may be dropped off in person at the front counter of the front entrance lobby in Town Hall. There is a drop box located outside of the front entrance for off/after hour deliveries. This drop box will be checked and emptied at 2:00PM on February 25, 2022.

4. Instructions to IP's (Bidder's)

The instructions to IP's as contained herein are expected to become part of the proposed/contract and part of the land acquisition and development agreement/contract to be entered into between the Town of Salem NH and the IP.

I. **Bidder's Responsibility** – Each IP shall be responsible for visiting the property via the site visit conducted on January 19, 2022, at 10:00AM and/or shall visit on their own and become fully acquainted with the conditions of the site. Failure to do so will not relieve the bidder of his/her obligations to comply with all terms and conditions necessary to carry out the provisions of any future Development Agreement. The Town has declared through the Remedial Action Plan representation of conditions of the property, including the environmental condition of the property. IP at its own expense shall be permitted to have the property inspected/examined for extent of environmental contamination prior to any agreement in certainty with the Town. When used "herein" the term "property" shall include all aspects of the property, such as, but not limited to, the soils and groundwater beneath it, including environmental documents and plans

II. **Arrangement for Site Inspection -** The Town of Salem will hold a public site meeting on Wednesday, January 19, 2022, at 10:00AM. After a short

overview with Town representatives including their environmental engineer, IP's may tour the property. While questions will be taken and answered, they will not be entered into the record unless submitted in writing and answered via an addendum posted by the Town of Salem.

III. Questions, Addendum, or Proposal Modification

Questions concerning this RFP must be submitted in writing or email to the Town Contact Person:

Salem Municipal Services
c/o Lyndsay Butler
33 Geremonty Drive
Salem, NH 03079
Email: lbutler@salemnh.gov

Questions/inquiries by email **MUST** have the subject line as: **"RFP 2021-027 PROPERTY ACQUISITION AND SITE DEVELOPMENT"** to be considered.

Questions/inquiries must be received by 5:00PM on February 7, 2022, to be considered. Questions/inquiries may be delivered, mailed, or emailed. Written responses will be posted on the Town's website: Current Bids, Proposals and Awards | Salem NH (townofsalemnh.org) by Addendum at 3:00PM on February 17, 2022. If any changes are made to this RFP, an Addendum will be posted on the Town's website. It is the sole responsibility of the IP to ascertain the existence of any addenda and/or modifications issued by the Town. As this RFP has been published on the Town's website, all IP's are responsible for checking the website for any addenda and /or modifications that are subsequently made to this RFP.

The Town accepts no liability for and will provide no accommodations to IP's who fail to check for addendums and/or modifications to this RFP and subsequently submit an inadequate or incorrect proposal. All proposals submitted in response to this RFP shall remain firm for sixty (60) days following the submittal deadline. The IP is not to communicate directly with any employee of the Town or its environmental engineer, except as specified in this RFP, and no other individual employee, representative, and consultant is authorized to provide any information or respond to any question or inquiry concerning this RFP at the risk of forfeiture.

The IP may communicate with the Contact Person, Lyndsay Butler, in the event this RFP is incomplete, or the bidder is having trouble obtaining any part of the RFP electronically through the Town website including, and without limitation, any form and/or attachments.

IV. Documents to be Submitted – The following documentation must be submitted as part of the proposal package:

A. ***Cover Letter***: as submitted shall state the name of the proposed purchaser and developer, whether an individual, partnership or corporation. This shall include the full names and addresses of all parties who will be the principal investors or owners of the property and who will become part of any contract or agreement. There should be at least one paragraph stating why the IP is interested in this acquisition.

B. ***Financial Portfolio***: Each IP must be able to show evidence that they possess the financial capability to acquire and develop the property. Said evidence may be in the form of financial statements or other documented evidence which will clearly display both the financial capability to acquire and develop the property and experiences and reputation to actually fulfill development commitments.

C. ***Project Portfolio:*** Development Projects by the IP that are similar in size and nature of this RFP. The IP should clearly demonstrate their ability to redevelop contaminated sites while managing the proper permits and including leveraging the necessary means forward including government grants and environmental cleanup funding mechanisms.

D. ***Bid Form:*** The IP must state their proposed purchase price and terms in both words and numerals using the attached Bid Form in Appendix A.

E. ***General Acknowledgement Form:*** The IP must acknowledge they understand the request put forth by the Town including acknowledgement of all relative documents attached hereto that impact any consideration given to their proposal. See the attached Acknowledgement Form in Appendix B.

F. ***Development Concepts:*** The IP should present at least one concept, preferably three, that they believe would best serve the property and which would benefit the Town. It is mutually understood that these are concepts, however the intent thereof should be genuine and that which the IP has demonstrated the ability to execute previously. In addition any award to this proposal does not guarantee Planning Board Approval which will still need to be followed accordingly. The Town would expect that the IP at a minimum has considered:

- compatibility with development project to adjacent properties
- whether or not the proposed use will be owner-occupied
- the projected future property tax yield
- perceived positive value and impact on parcel and abutting neighborhood
- other appropriate facts/considerations relevant to the development of the property

V. **Qualifications of Bidder** – The Town may make such investigations as it deems necessary to determine the ability of the bidder to acquire the property and perform the development under the conditions as provided for herein. All IP's shall furnish the Town with all pertinent information and data for this purpose. The Town reserves the right to reject any bid if the evidence submitted by, or investigation of, such IP fails to satisfy the Town that the IP is properly qualified or able to carry out the obligations as contemplated herein. Conditional bids will not be accepted.

VI. **Purchase Agreement, Closing and Performance** – The successful bidder will be expected to suggest a proposed closing date in the proposal that may be subject to change as applicable regarding environmental compliance. The closing will require execution of all legal documents, purchase agreements and contracts as may be required to consummate a complete sale including payment for acquisition of the property and other required agreements that will need to be executed to guarantee development in accordance with the terms and conditions as outlined herein and as may be negotiated with the successful IP. Throughout the process, the property may be subject to taxation, as well as federal, state and municipal laws; easements and restrictions of record.

VII. **Withdrawal of Bids** – Bids may not be withdrawn for a period of sixty (60) calendar days after the date of opening unless the consent of the Town is given. Negligence on the part of the bidder in preparing the bid confers no right for withdrawal of the bid after it has been opened.

5. Comparative Evaluation Criteria

All proposals will be evaluated based upon the specific documents requested in Section IV. The following point schedule and general narrative will be utilized accordingly:

Highly Advantageous	3-5 points	Response excels on the specific criterion
Advantageous	2 points	Response meets evaluation standard for the criterion
Least Advantageous	1 point	Response does not fully meet the criterion or leaves a question or issue not fully addressed
Does Not Meet	0 points	Does not address the criterion

NOTE: Section IV(E) will not be scored but needs to be fully acknowledged.

6. Selection and Award

The Town may select as many as three proposals depending on the quality and number of submittals. The selection will be done by a five member panel of relative Town officials. Finalists may be required to appear for an interview, presentation, and/or

provide additional information to the Town and its representatives. The Town reserves the right to award to the proposal that is in the best interest of the Town, all things considered, and not exclusively to the highest bid. An award if any may be announced by May 1, 2022, at the earliest.

ACKNOWLEDGEMENT FORM

The following is Acknowledged by the Purchaser (IP) or Developer submitting the Proposal as inferring "I" as the IP and/or supporting team:

Check box and sign below

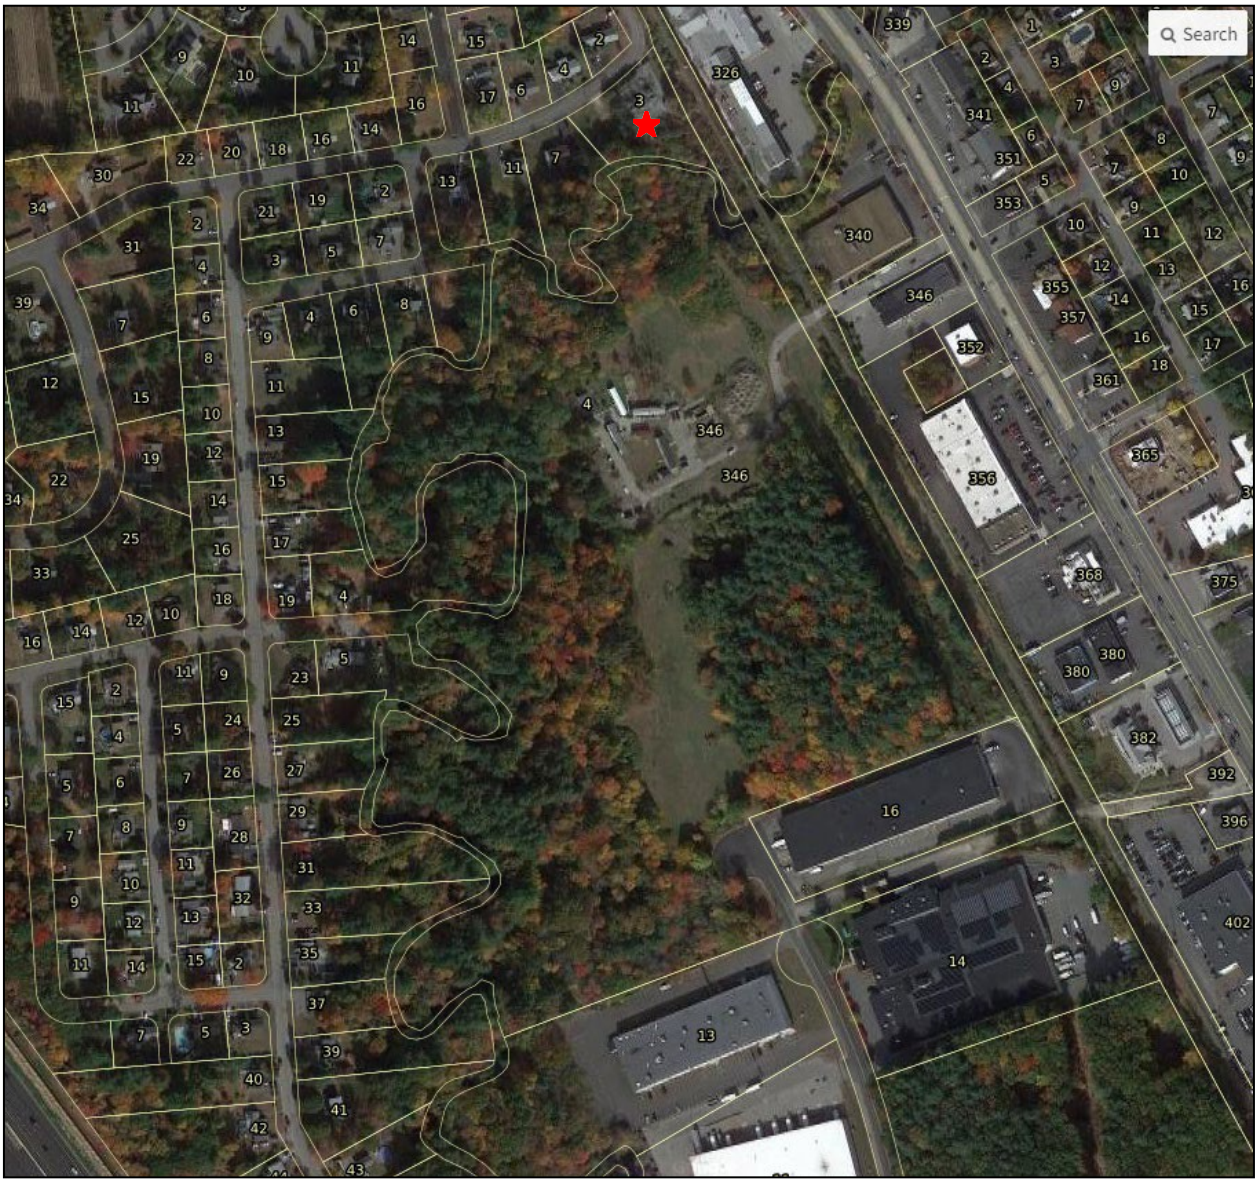
☐ I affirm that I have received and reviewed all attachments in the Appendix as submitted through this RFP.

☐ I affirm that I have viewed the property and understand its location and zoning requirements.

☐ I affirm that I have read the Pre-Design Investigation Summary Report, Remedial Action Plan Addendum, and understand the extents of contamination on the property by which will need to be remediated.

☐ I affirm my understanding that I as the IP, purchase/developer, must submit and gain approval of a site plan that must meet all of Town of Salem requirements and must follow all other normal procedures for acquiring permits for site development and construction.

☐ I affirm my understanding that the property is subject to an approved Development Agreement and that the proposed use is conceptually sound but will require amendments thereof to the proposal as set forth herein.



☐ I affirm that I understand the Town of Salem's site plan approval and Planning Department processes which must be followed for any redevelopment that may be borne by this RFP.

LICENSE AGREEMENT

Agreement made, effective as of **July 9, 2021,** by and between Town of Salem, a New Hampshire municipal corporation, with a mailing address of 33 Geremonty Drive, Salem, New Hampshire 03079, herein referred to as "Licensor", and Salem Animal Rescue League (SARL), a New Hampshire Non-Profit corporation, with a mailing address of 4 SARL Drive, Salem, New Hampshire 03079, herein referred to as "Licensee."

The parties agree as follows:

SECTION ONE
Grant of Permission

In consideration of Licensee's promises contained in this Agreement, Licensor gives permission, revocable and terminable as provided below, to Licensee to enter on the real property of Licensor described below and utilize the buildings thereon on a non-exclusive basis for the purpose of operating and maintaining animal shelters and related activities on Licensor's property as described in Section Two below, all on the terms and conditions set forth in this Agreement, with which Licensee promises to comply and abide.

SECTION TWO
Description of Property

The real property of Licensor that Licensee is permitted to enter under and pursuant to this Agreement is located in the Town of Salem, County of Rockingham, State of New Hampshire, and more particularly described as follows: 32 acres off of South Broadway, Salem, New Hampshire, being a portion of the Town of Salem Tax Map 143, Lot 9475. The particular portion of the real property that the Licensee may use is shown on Exhibit A attached hereto and incorporated herein. THE LICENSEE HEREBY ACKNOWLEDGES THAT IN AREAS OF THE PREMISES NOT SHOWN ON EXHIBIT A, CONDITIONS WHICH MAY BE DANGEROUS TO THE PUBLIC AND PARTICULARLY TO UNSUPERVISED CHILDREN MAY EXIST AND HEREBY AGREES TO NOT ALLOW ANY OF ITS STAFF OR VISITORS OUTSIDE OF THE AREA SHOWN ON EXHIBIT A. SUCH AREAS SHALL BE POSTED WITH "NO TRESPASS" SIGNS WHICH SHALL BE MAINTAINED BY THE LICENSEE.

SECTION THREE
No Monetary Consideration

The permission granted to Licensee under this Agreement is given to Licensee as an accommodation to Licensee and it shall be without charge to Licensee so long as Licensee provides coverage at the Town Kennel when necessary. Licensee acknowledges the title of Licensor to the above-described real property and agrees never to assail, resist, or deny such title.

SECTION FOUR
Permission Not Exclusive

The permission granted to Licensee under this Agreement is not exclusive to Licensee and Licensee shall have the privilege under this Agreement only of utilizing such portion of the above-described premises as the representative of Licensor in charge of such premises shall designate from time to time within the portion of the premises designated on Exhibit A. Building designated as "Town Kennel" on Exhibit A shall be occupied exclusively by Licensor but may be utilized by the Licensee for limited purposes when it is providing coverage for the Town Animal Control Officer.

SECTION FIVE
Buildings or Structures

Licensee may occupy only the three/four/five modular structures and/or trailers on the above-described property, and the Town Kennel on a limited basis as noted hereinabove and may not erect any temporary structures, fixtures, shelters or attachments except with the prior written consent of the Town Manager. Licensee shall be solely responsible for the maintenance, repair and /or replacement of all structures and equipment that it has on the property.

SECTION SIX
Hold Harmless; Insurance

The Licensee shall hold the Licensor harmless from any liability or damages, including its attorneys' fees, arising from the public's use of the property, unless caused by Licensor's willful or wanton misconduct. The Licensee shall maintain liability insurance for bodily injury and property damage arising from Licensee's and the public's use of the property, with contractual liability coverage and coverage limits customary for uses of this nature, which policies shall list Licensor as an additional insured. Annually, on or before June 1 of each year, the Licensee shall provide an insurance certificate to the Licensor for review and approval.

SECTION SEVEN
No Commercial Use or Nuisance

Licensee shall not use nor shall it allow any portion of the premises to be used for uses not included in its non-profit purpose as an animal rescue facility or for any profit-making commercial purposes, and shall not perform or permit any of Licensee's agents, employees or invitees to perform any disorderly conduct or commit any nuisance on such property or to use such property in any way so as to interfere with the exercise by Licensor of its use of the property.

SECTION EIGHT
Utilities/Other Services

Licensee shall pay for all utility and other services furnished to or for Licensee on the above-described property.

SECTION NINE
Privileges Not Assignable

Licensee's privileges under this Agreement shall not be assignable by Licensee in whole or in part.

SECTION TEN
Term; Termination

The term of this License Agreement shall be for **two (2)** years commencing **July 9, 2021, and ending on July 9, 2023.**

Both parties reserve the right to terminate the permission granted by this Agreement at any time by giving the other party a minimum of **six (6) month's** written notice of such termination, except that Licensor may, at its election, terminate the permission immediately without such notice at any time if Licensee shall fail to comply with or abide by each and all of the provisions of this Agreement or to keep all of Licensee's promises contained in this Agreement.

SECTION ELEVEN
Notice

Any notice provided for or concerning this Agreement shall be in writing and be deemed sufficiently given when sent by certified or registered mail if sent to the respective address of each party as set forth at the beginning of this Agreement.

SECTION TWELVE
Removal of Property

On revocation, surrender, or other termination of the permission granted by this Agreement, Licensee shall quietly and peaceably surrender the portion of the above-described property occupied by Licensee in as good condition as such property was at the time of Licensee's entry on such property under this Agreement and shall remove all fixtures, equipment, and other personal property placed by Licensee on such property, and if Licensee shall fail to do so, Licensor shall have the right to make such removal at Licensee's expense, the amount of which expense Licensee shall pay to Licensor on demand, and, if Licensor shall so elect, it shall have the right to take possession of and appropriate to itself without payment therefor any property of Licensee, or anyone claiming under Licensee, then remaining on the above-described property.

SECTION THIRTEEN
Governing Law

It is agreed that this Agreement shall be governed by, construed, and enforced in accordance with the laws of the State of New Hampshire.

SECTION FOURTEEN
Effect of Partial Invalidity

The invalidity of any portion of this Agreement will not and shall not be deemed to affect the validity of any other provision. In the event that any provision of this Agreement is held to be invalid, the parties agree that the remaining provisions shall be deemed to be in full force and effect as if they had been executed by both parties subsequent to the expungement of the invalid provision.

SECTION FIFTEEN
Entire Agreement

This Agreement constitutes the entire agreement between the parties and any prior understanding or representation of any kind preceding the date of this Agreement shall not be binding on either party except to the extent incorporated in this Agreement.

SECTION SIXTEEN
Modification of Agreement

Any modification of this Agreement or additional obligation assumed by either party in connection with this Agreement shall be binding only if evidenced in writing signed by each party or an authorized representative of each party.

In witness, each party to this Agreement has caused it to be executed at Salem, New Hampshire on the date(s) indicated below.

4) THE SUBJECT PROPERTY IS LOCATED IN THE COMMERCIAL-INDUSTRIAL, SUBDISTRICT C (CI-C) ZONING DISTRICT. BUILDING SETBACKS ARE AS FOLLOWS: FRONT 30'; SIDE 20'; REAR 20'. FINAL DETERMINATION IS MADE BY THE TOWN OF SALEM ZONING OFFICIALS.

5) SUBJECT PREMISES IS LOCATED PARTIALLY IN ZONE X AND PARTIALLY IN ZONE AE AS SHOWN ON FEMA FLOOD INSURANCE RATE MAP(S) FIRM 33015C0564E, EFFECTIVE DATE: MAY 17, 2005.

6) EASEMENTS AND/OR RIGHTS-OF-WAY AS SHOWN ARE THOSE FOUND DURING OUR RESEARCH OF THE SUBJECT PROPERTY AND ABUTTING TRACTS. IN ADDITION, THE SUBJECT PREMISES MAY BE SUBJECT TO AND/OR WITH THE BENEFIT OF THE FOLLOWING:

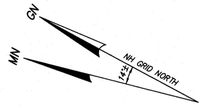
a) VARIOUS "FARM CROSSINGS" AND/OR RIGHTS OF WAY AS RECITED AND/OR DEPICTED IN AND ON DOCUMENTS OF RECORD TO THE EXTENT THE SAME AFFECT AND BENEFIT THE SUBJECT PREMISES (SEE REFERENCE PLANS AS NOTED ABOVE, DEED TO JOHN J. KEALEY DATED AUGUST 29, 1923, BOOK 777 PAGE 288 AND DEEDS TO THE TOWN OF SALEM AT BOOK 1667 PAGES 288 & 290).

b) GRANT OF EASEMENT FROM STILLMAN E. KEALEY ET UX TO GRANITE STATE ELECTRIC COMPANY DATED JUNE 7, 1960, BOOK 1552 PAGE 111 (SEE PLAN 03219).

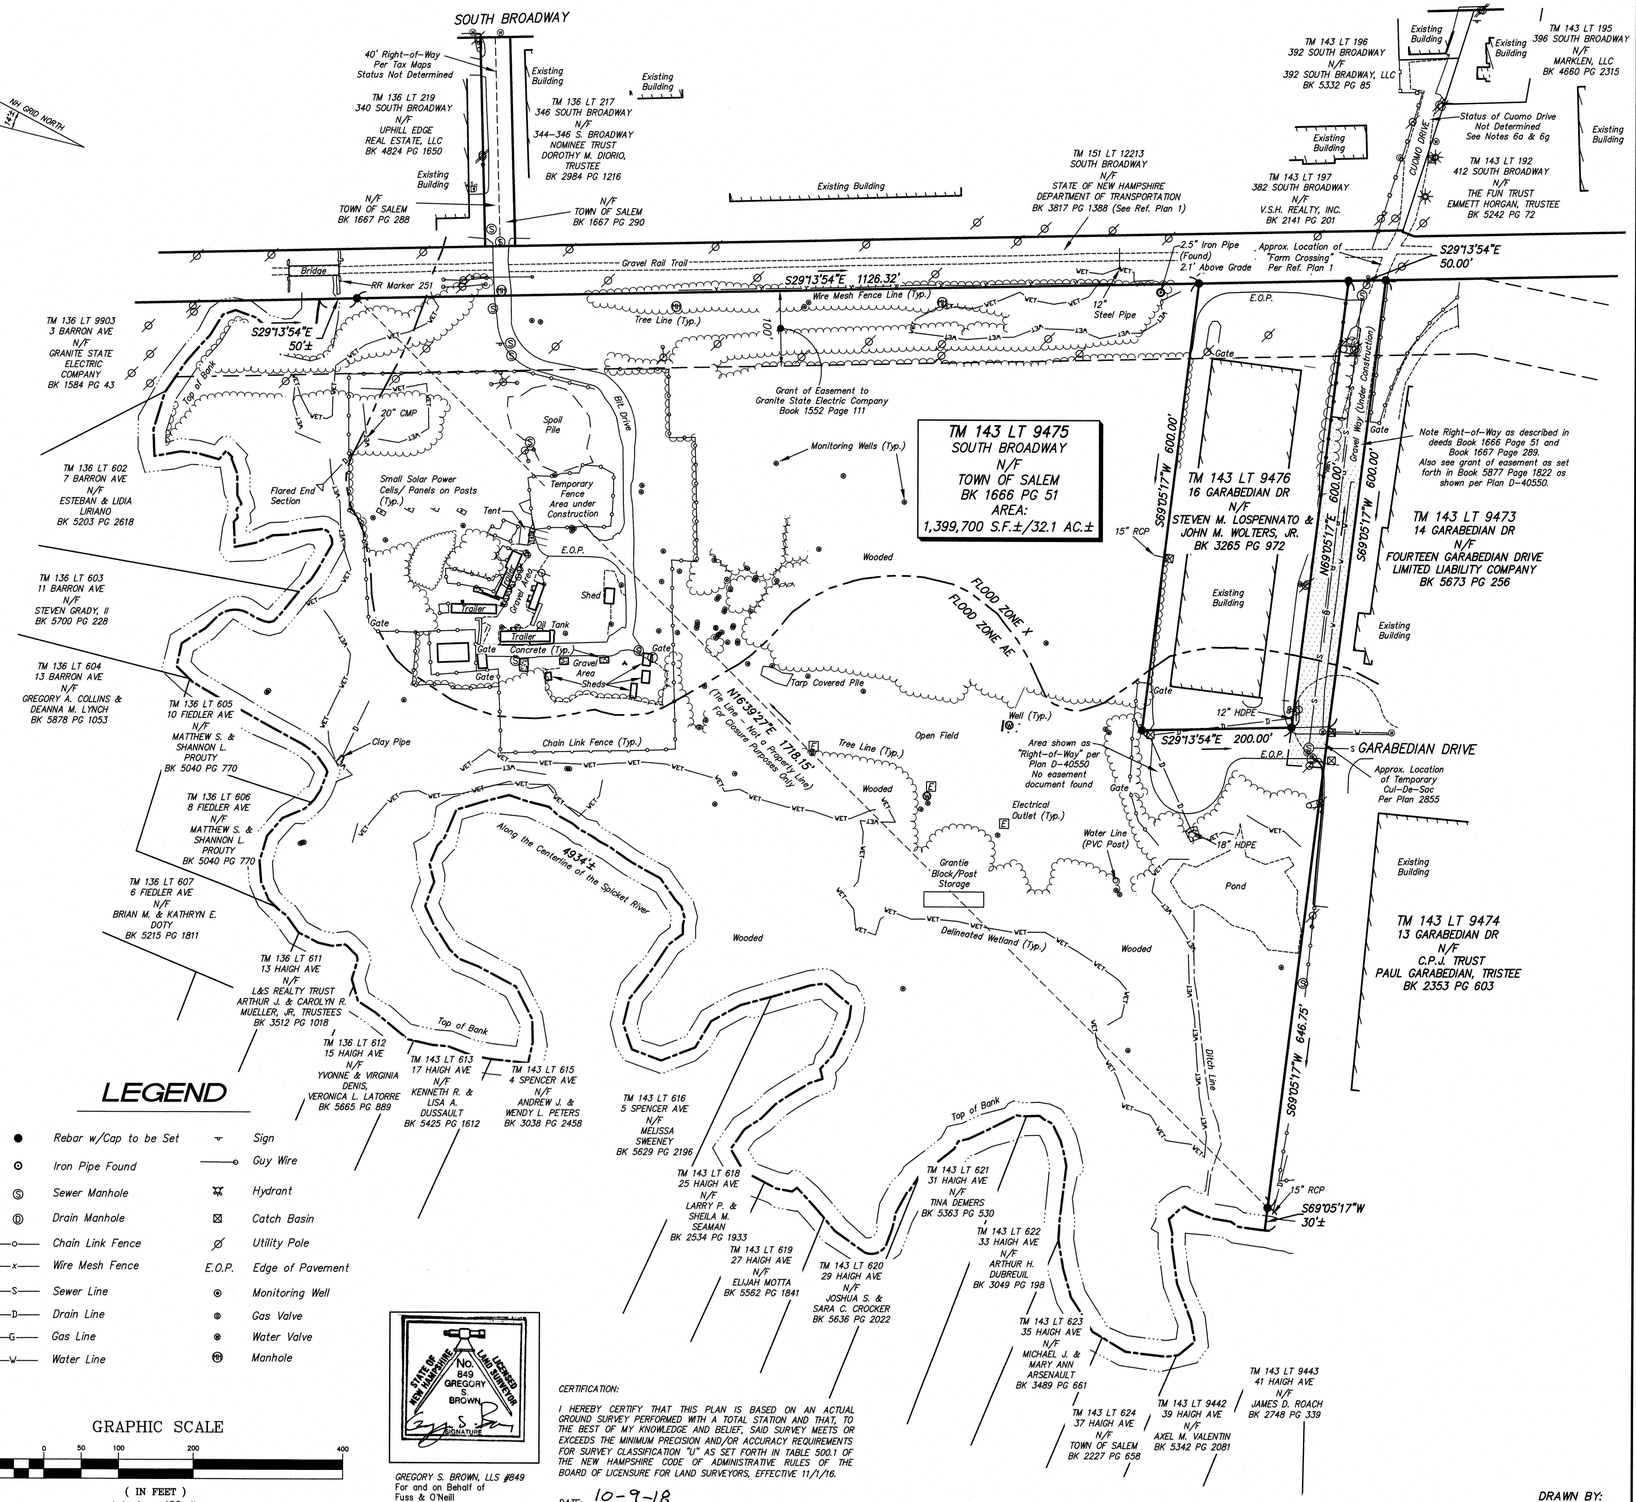
c) SUBJECT TO A RIGHT-OF WAY AS DESCRIBED IN DEED FROM KEALEY TO THE TOWN OF SALEM BY DEED DATED APRIL 8, 1963 BOOK 1666 PAGE 51.

d) SUBJECT TO A RIGHT-OF-WAY AS GRANTED FROM, STILLMAN E. KEALEY ET UX TO ARMAND COCCHIARO ET AL DATED APRIL 8, 1963, R.C.R.D. BOOK 1667 PAGE 289.

e) GRANT OF WATER AND SEWER RIGHTS FROM CONSTRUCTION INDUSTRIES INCORPORATED TO THE TOWN OF SALEM DATED MAY 18, 1970, BOOK 2020 PAGE 496 TO THE EXTENT THE SAME MAY BENEFIT THE SUBJECT PREMISES.



f) GRANT OF EASEMENT FROM THE TOWN OF SALEM TO NEW ENGLAND TELEPHONE AND TELEGRAPH COMPANY DATED MAY 31, 1978, R.C.R.D. BOOK 2312 PAGE 1449.



g) GRANT OF 20 FOOT WIDE WATER LINE EASEMENT FROM CUMBERLAND FARMS, INC. TO THE TOWN OF SALEM DATED FEBRUARY 9, 2016, R.C.R.D. BOOK 5693 PAGE 622 (SEE PLAN D-39324).

h) AGREEMENT AND GRANT OF EASEMENT BY AND BETWEEN FOURTEEN GARABEDIAN DRIVE LIMITED LIABILITY COMPANY AND HE TOWN OF SALEM DATED NOVEMBER 29, 2017, R.C.R.D. BOOK 5877 PAGE 1822 (SEE PLAN D-40550).

7) UTILITY STRUCTURES AT OR ABOVE THE GROUND SURFACE SHOWN HEREON ARE THOSE THAT HAVE BEEN OBSERVED FROM SURFACE EVIDENCE. UTILITIES BENEATH THE GROUND SURFACE HAVE NOT BEEN OBSERVED AND ARE SHOWN APPROXIMATELY HEREON AS DERIVED FROM A COMBINATION OF SURFACE MARKINGS BY OTHERS AND/OR RECORD INFORMATION AND ARE NOT VERIFIED LOCATIONS OR CONFIRMATION OF EXISTENCE OF SAID UNDERGROUND UTILITIES. ALL UNDERGROUND UTILITIES SHOULD BE LOCATED IN THE FIELD PRIOR TO COMMENCEMENT OF ALL SITE WORK. CALL DIG SAFE 1-888-344-7233 A MINIMUM OF 72 HOURS PRIOR TO PLANNED ACTIVITY.

8) WETLANDS DELINEATED BY GOVE ENVIRONMENTAL SERVICES, INC. DURING JULY 2018.

SALEM, NEW HAMPSHIRE
NHDES #198405033

1.0 INTRODUCTION

This report presents the results of the Pre-Design Investigation (PDI) activities related to the proposed remediation of volatile organic compound (VOC) impacts at the Former Salem Wastewater Treatment Facility (WWTF) property in Salem, New Hampshire (the Site). PDI field activities were completed by Woodard & Curran, Inc. (Woodard & Curran) on behalf of the Town of Salem (the Town), in general accordance with the PDI Work Plan (PDI Work Plan) approved by the New Hampshire Department of Environmental Services (NHDES)[1].

This report also includes a screening of remedial alternatives and a recommended remedial approach to address impacted soil and groundwater at the Site. The Town authorized GeoInsight, Inc. (GeoInsight) in September 2020 to prepare remedial contractor bid specifications with the goal of soliciting remediation bids in December 2020/January 2021 and initiation of remedial activities in spring 2021.

The Town retained GeoInsight in February 2020 to address soil and groundwater impacts currently managed under NHDES Groundwater Management Permit (GMP) #GWP-198405033-S-005, including compiling and summarizing the data gathered during PDI field activities and conducting a screening of potential remedial alternatives based upon the PDI findings and other investigations previously completed at the Site. Prior investigations and remedial actions at the Site were primarily completed by GZA GeoEnvironmental, Inc. (GZA) on behalf of the Town from the late-1980s until November 2018.

[1] *Pre-Design Investigation Work Plan*, prepared by Woodard & Curran, dated April 8, 2019, approved by NHDES in correspondence dated May 28, 2019.

The PDI Work Plan also included sampling and analysis of soil stockpiled at the Site from a 2017 Town utility improvement project (South Broadway Sewer, Water, and Bridge Improvements). The results will assist in evaluating possible uses for the soil, and in particular, as backfill for the former WWTF building subgrade structure.

GeoInsight's services and this PDI Summary Report and Remedial Action Plan (RAP) Addendum are subject to the Limitations provided in Appendix A.

2.0 BACKGROUND

A summary of the Site background is provided below and is based upon GeoInsight's review of key historical reports for the Site, which were available from the NHDES OneStop website and the Town. These reports included Woodard & Curran's 2019 Periodic Summary Report[2], GZA's 2017 Periodic Summary Report[3], GZA's 1989 Phase II Hydrogeologic Study[4], and other reports referenced in the Sections below.

2.1 SITE DESCRIPTION

The Site address was formerly 346 South Broadway (NH Route 28), in Salem, New Hampshire. The Site is accessed via a right-of-way (SARL Drive) that extends from South Broadway to the northeastern portion of the Site, and via a gated entry off Garabedian Drive to the south. The location of the Site in relation to South Broadway (NH Route 28) and the surrounding area is shown on the Locus Plan provided as Figure 1. The Site property is approximately 32 acres in size and is comprised of two parcels identified as Lot 9475 on the Town's Tax Parcel Maps 136 and 143.

Municipal WWTF operations previously took place in the northern portion of the Site (as described in more detail below). The former WWTF structures have since been demolished, except for the subgrade foundation structure for the former WWTF building, which consists of an approximately 30-foot deep, two-story basement and abutting 30-foot deep, two-story -"wetwell." The Town is currently evaluating recently received bids for demolition and closure of this structure and intends to execute a contract and begin demolition activities by the end of December 2020.

The northern portion of the Site, in the area of the former WWTF building, is currently occupied by the Salem Animal Rescue League (SARL), which operates out of several temporary

[2] *2017-2018 Periodic Summary Report*, prepared by Woodard & Curran, dated February 25, 2019
[3] *Periodic Summary Report – 2015 and 2016*, prepared by GZA, dated May 3, 2017
[4] *Phase II Hydrogeologic Study*, prepared by GZA, dated December 1989

buildings. An approximately 2,000 cubic yard (CY) soil pile from the 2017 Town utility improvement project ("current" soil pile) is also located in this area (sampling of this stockpile, which contains asphalt fragments, is further described in Section 3.2.1). Portions of this area of the property are surrounded by a chain-link fence, and a locked gate separates this area from the southern portion of the Site.

The Spicket River forms the western and northern boundaries of the Site, and portions of the Site are located within the 100-year floodplain of the river. Wetlands are located adjacent to the Spicket River, and the remainder of the Site is largely wooded, with some areas of open fields that are mowed by the Town. During a survey conducted at the Site in 2018, a small pond was noted near the southern Site boundary, near Garabedian Drive. Previous reports describe a culvert entering the southeast portion of the Site from South Broadway that discharged to a drainage swale and into a wooded area in this portion of the Site. A fence is also located at the end of Garabedian Drive to restrict access to the property from the south.

The Site is relatively flat, with less than a 4-foot difference in elevation across most of the Site. Steeper grades are present near the embankment of the Spicket River in the northern and western areas of the Site. Reportedly, fill was placed in low-lying areas in the northern and western portions of the Site, presumably during construction of the WWTF. Fill was also observed in some of the borings completed during the PDI, as described below.

A sewer interceptor/connector pipe was installed at the property in 1986, which runs from the area of the former WWTF on SARL Drive through the Site to Garabedian Drive to the south. The sewer connector was added when the WWTF was decommissioned, and the Town connected to the Greater Lawrence Sanitary District (GLSD) for sanitary sewage treatment and disposal.

GeoInsight visited the Site in April 2020 to observe key Site features in the central and southern portions of the Site. Several piles of soil and concrete construction debris were noted, as well as

an area of what appeared to be remnant totes and pallets from some of the previous bioremediation efforts.

Current Site features are shown on the Site Features and Exploration Location Plan provided as Figure 2A. GeoInsight's April 2020 Site visit observations are noted on Figures 2B and 2C.

2.2 SITE SETTING

The Site is located in a mixed-use area of Salem, New Hampshire with commercial and industrial developments to the east and northeast along South Broadway and to the south along Garabedian Drive. Residential development is located to the west and north of the Site, across the Spicket River. Surrounding properties are served by municipal water and sewer service. A recreational trail abuts to the Site to the east.

2.3 FORMER SITE USES AND RELEASE HISTORY

The Town constructed the WWTF at the Site in 1964. Prior to that time, the Site appears to have been used for agricultural purposes. Expansions of the WWTF were completed in 1972 and 1973 with the addition of filters and digesters. The WWTF structures were demolished between 2017 and 2019 by the Town and formerly included:

- the WWTF Building;
- the Control Building;
- two concrete trickling filters;
- two settling tanks;
- a former 200-gallon petroleum underground storage tank (UST);
- four concrete-bermed sludge drying beds; and
- piping and access structures.

The WWTF operated until 1986, when the sewer connector was constructed to connect the Town sewer system to the Greater Lawrence Sanitary District. The locations of the former WWTF

structures are shown on Figures 2A to C, and a detailed plan of the former structures is provided in the PDI Work Plan in Appendix B.[5]

Reportedly, the WWTF treated approximately 2 million gallons per day of both domestic and industrial wastewater. Treated wastewater was discharged to the Spicket River. Occasionally, industrial wastewater received at the facility would destroy the microorganisms used for biological treatment, and the resulting impacted sludge would be placed in sludge pits located south of the WWTF structures. Reportedly, this practice occurred during the first five to ten years of the WWTF operations and may have resulted in chlorinated volatile organic compound (CVOC) releases to the subsurface. Septic haulers were also suspected to have occasionally illicitly directly-discharged materials to the pits, which were previously accessible via an unimproved road onto the Site from Garabedian Drive (this entrance has since been gated and fenced off). The illicit discharges may also have contributed to CVOCs being released to the subsurface. By 1986, all but one of the pits had been covered with fill. Following cessation of WWTF operations, septic haulers reportedly discharged directly into the sewer main through a manhole in the southern portion of the Site.

Based upon observations of historical aerial photographs from 1962 to 1986[6], a feature that appears to be an open channel of water is visible on photographs from 1962 (prior to construction of the WWTF) and 1966 (following construction of the WWTF). Remnants of the channel appear in photographs from 1974 and 1988, in the vicinity of the last sludge disposal pit. The approximate location of the former open channel is shown on Figures 2A to C.

During excavation for the sewer connector line at the Site in 1986, impacted soil and groundwater were encountered. According to a summary of a March 1986 notification report to NHDES, a strong chemical odor, dark gray soils, and groundwater with brown foam were observed during excavation. GZA's 1989 Phase II Hydrogeologic Report indicates that workers

[5] See *Appendix A: Excerpts of Documents for Reference to Historic Features* in the PDI Work Plan provided in Appendix B of this report.
[6] See *Appendix A: Excerpts of Documents for Reference to Historic Features* in the PDI Work Plan provided in Appendix B of this report.

encountered what appeared to be deposits of black sludge and reportedly experienced nausea. Stained soil was observed at a depth of 5 to 6 feet below ground surface (bgs) in the 16- to 18-foot deep excavation, and three impacted locations were reportedly encountered. During construction, impacted soils were excavated and stockpiled in areas, one north of the former open channel (northern former soil pile) and the other west of the sewer line (southern former soil pile), as indicated on Figures 2A to C. The soil piles remained at the surface until at least 1996, when they were sampled, and analytical results at that time did not indicate VOCs greater than applicable standards.

Following discovery of the impacted soils, numerous investigations were completed, as described in more detail below. The primary release appears to have been CVOCs; however, petroleum-related constituents have also been observed in soil and groundwater near source areas, and polychlorinated biphenyls (PCBs) were detected in groundwater in one sample during one event in 2017 near the former WWTF building (PCBs were not detected above laboratory reporting limits in groundwater samples from 2018, 2019, and 2020). Most recently, per- and polyfluoroalkyl substances (PFAS) were detected in Site groundwater at concentrations greater than Ambient Groundwater Quality Standards (AGQSs). The nature and extents of PFAS and PCBs in groundwater will be discussed as part of the upcoming GMP Renewal Application and are not discussed further in this report.

2.4 SUMMARY OF PREVIOUS INVESTIGATIONS AND REMEDIAL ACTIVITIES

The Town hired GZA in 1987 to investigate the nature and extent of the soil and groundwater impacts encountered during the sewer connector line construction. Numerous hydrogeologic investigations ensued over the next 30 years to characterize the CVOCs and petroleum hydrocarbon source areas, identify and evaluate potential impacts and risks to environmental receptors, and provide the basis for selecting remedial alternatives for the Site. A detailed summary of these investigations can be found in Woodard & Curran's 2019 Periodic Summary Report, which is excerpted in Appendix C of this report. Key data from these investigations are also provided in tables in Appendix C.

Initially, GZA concluded that constituents of concern (COCs) were residual concentrations and primarily dissolved in groundwater. As such, enhanced bioremediation was selected in the 1997 RAP[7] as the most appropriate technology to remediate the Site. Between 1997 and 2005, GZA implemented enhanced reductive dichlorination (ERD) technology by injecting a cumulative total of approximately 3.4 million gallons of a liquid mixture comprised of lactose and Brewer's yeast into Site monitoring wells and into two approximately 250-foot long shallow infiltration trench systems.

Subsequent investigations in areas upgradient from the bioremediation areas identified unaddressed source areas and included the observation of dense non-aqueous phase liquid (DNAPL) in test well GZ-TW-1L during its installation in 2014[8] as part of a Zero Valent Iron (ZVI) pilot study. The 2015 RAP Addendum recommended full-scale ZVI/ERD to address CVOCs in the upper hydrogeologic unit, but the remedy was not implemented. Subsequent to the observation of DNAPL, GZA completed a high-resolution investigation of potential source areas that included completion of 51 borings using a Membrane Interface Probe (MIP) in November 2015 and collection of soil samples for laboratory analysis from 10 of the MIP locations in June 2016. The results of the MIP investigation are provided in GZA's May 2017 Periodic Summary Report, and analytical results are tabulated in Appendix C.

In 1993, NHDES issued a GMP to manage impacted groundwater at the Site. The current permit (# GWP-198405033-S-05) requires sampling in June and November of each year, with submittal of Periodic Summary Reports in 2017 and 2019. These reports were submitted by GZA and Woodard & Curran, respectively. The current permit expires on October 19, 2020, and a renewal application was submitted to NHDES on October 19, 2020.

2.5 SITE GEOLOGY

The Site is underlain by sediments primarily within four distinct stratigraphic units:

[7] *Remedial Action Plan*, prepared by GZA, dated April 25, 1997
[8] *Remedial Action Plan Addendum*, prepared by GZA, dated August 20, 2015

- **Upper Sand Unit (USU):** Laterally continuous alluvial fine sand, with varying amounts of silt, from surface grade to approximately 20 to 25 feet bgs;

- **Silty Clay Unit (SCU):** Laterally discontinuous glaciolacustrine silt and clay, with occasional interbedded fine sand, from approximately 20 to 25 feet bgs to 30 to 35 feet bgs;

- **Lower Sand Unit (LSU):** Glaciofluvial sand to sand and gravel[9], from approximately 30 to 35 feet bgs to 45 to 50 feet bgs; and

- **Till Unit:** Fine-to coarse sand with varying amounts of silt and gravel to silty-clay from 45 to 50 feet bgs to the bedrock surface at approximately 50 to 60 feet bgs.

Bedrock mapping for the Site area indicates that the Site is underlain by the Berwick Formation of the Merrimack Group, and consists of a quartz-biotite-feldspar granofels or schist. Bedrock observed in previous explorations at the Site is consistent with this formation.

In the 2017 Periodic Summary Report, GZA described a generally northwest-trending trough in the top of the bedrock surface and till unit that appeared to extend south of the former sludge drying beds towards the river. A similar feature is present in the top of the LSU, but appears to be centered southeast of the former sludge drying beds. GZA noted that in general, the glaciolacustrine SCU was not present in the bedrock/till surface trough.

In addition, fill material was described in previous reports as having been placed in the northern portion of the Site, presumably as part of construction of the former WWTF. Borings completed as part of the PDI also noted fill materials, including asphalt and crushed concrete in some of the borings near the southern former soil pile, and plastic pieces, hair, and coal in some of the borings completed in/near the former open channel.

[9] Note, these deposits were described as sandy glacial till and sand and gravel deposits in reports by GZA prepared prior to 2015.

2.6 SITE HYDROGEOLOGY

Of significance is the presence of the low permeability glaciolacustrine SCU (aquitard) that divides an upper aquifer in the USU (upper hydrogeologic unit) and a lower aquifer in the underlying LSU and till (collectively, the lower hydrogeologic unit). Although groundwater likely moves from the upper aquifer to the lower aquifer through the SCU, it occurs at a very slow rate. The SCU is laterally discontinuous across the Site, as indicated above. In general, monitoring wells designated with a "U" are screened in the upper hydrogeologic unit, while those designated with a "L" are screened in the lower unit, although there are exceptions to this nomenclature. Specifically, "L" denotes screening in the lower part of the upper hydrogeologic unit at several monitoring well locations.

Hydraulic properties presented by GZA in the 2017 Periodic Summary Report are provided in the table below. These values are reportedly based upon hydraulic testing of individual wells, published values, and numerical simulations of groundwater flow.

Unit	PARAMETER					
	Tested or Published Horizontal Hydraulic Conductivity (cm/sec)	Model Horizontal Hydraulic Conductivity (ft/day) /(cm/sec)	Vertical Anisotropy	Vertical Hydraulic Conductivity (ft/day)/(cm/sec)	Effective Porosity	Specific Yield
Bedrock	10^{-2} – 10^{-6} (2)	0.2/7.1x10^{-5}	1	0.2/7.1x10^{-5}	0.05	0.05
Glacial Till	4.1x10-4 (1; one value, GZ-202L)	3.0/1.1x10^{-3}	3	1.0/3.5x10^{-4}	0.20	0.15
Glaciofluvial Sand	4.9x10^{-3} – 3.4x10^{-4} (1)	8.5/3.0x10^{-3}	5	1.7/6.0x10^{-4}	0.25	0.20
Glaciofluvial Gravel	1 – 10^{-1} (2)	200/7.1x1^{-2}	1	200/7.1x1^{-2}	0.30	0.25
Glaciolacustrine	10^{-4} – 10^{-10} (2)	0.22/7.8x10^{-5}	10	0.022/7.8x10^{-6}	0.30	0.15
Alluvium	5.6 x10^{-3}–4.8x10^{-5} (1)	5.0/1.7x10^{-3}	10	0.5/1.8x10^{-4}	0.25	0.20

Notes:
1. "ft/yr" indicates feet per year; "cm/sec" indicates centimeters per second.
2. In the second column, (1) indicates site value for unit; and (2) indicates published value for material type.

Groundwater flow direction in the upper hydrogeologic unit reportedly changes based upon the river level and the amount of precipitation, but groundwater flow is generally towards the river. In addition, groundwater flow in this unit could potentially be influenced by the sewer line and well sorted, coarser grained bedding material around the pipe. Groundwater flow direction in the lower unit is reportedly more consistent, generally towards the river. GeoInsight notes some inconsistencies with the groundwater elevation contours generated from data collected in 2019

compared to previous monitoring events, as described more below. Groundwater elevation contours for both the upper and lower hydrogeologic units for the 2019 monitoring rounds are provided on Figure 3.

Based upon GZA's previous surface water and sediment pore water sampling activities near the GZ-900 series wells in the northwest of the Site and measured upward vertical hydraulic gradients in well couplets near the river (see Section 4.1), overburden Site groundwater discharges to the Spicket River.

Two bedrock monitoring wells are located at the Site: GZ-1B, which is located near the northeast property boundary near the SARL Drive entrance; and GZ-3B, which is located between the southern former soil pile and the Spicket River. GZA previously reported that shallow bedrock groundwater flow information in the Site vicinity is limited and that regional groundwater flow in shallow bedrock via fracture flow is anticipated to be towards the south to southeast. Groundwater elevation data for GZ-3L / GZ-3B indicate an upward vertical gradient in this area of the Site, while the limited data for GZ-1B / GZ-1L (from one round in 2016), indicate a slight downward gradient.

2.7 SENSITIVE RECEPTORS

As indicated above, the Spicket River forms the northern and western boundaries of the Site. Sediment pore water sampling was completed by GZA[10]. From GZA's evaluation, one or more CVOCs including, tetrachloroethene (PCE), trichloroethene (TCE), cis- and trans-1,2-dichloroethene (DCE), 1,1-dichloroethane (DCA), 1,1-DCE, vinyl chloride (VC), 1,1,1-trichloroethane (TCA), chloroethane, and chloroform were detected in the sediment pore water samples collected from four of the six stations, of which three locations exceeded at least one AGQS, but all were at concentrations below Water Quality Criteria for Toxic Substances (WQCTS), Fresh Chronic Criteria. GZA concluded that the results are consistent with a discharge of CVOCs from Site groundwater to the Spicket River. However, surface water

[10] *Periodic Summary Report – 2015 and 2016*, prepared by GZA, dated May 3, 2017

samples collected from the Spicket River under the GMP-required sampling in November of each year have had low-level to non-detectable levels of CVOCs since sampling began in 2010.

The residential properties located near the Site are serviced by municipal water and sewer. A vapor intrusion study completed by GZA concluded that the data collected did not indicate potential for vapor migration to buildings on residential properties west of the Spicket River[11]. Because VOCs have been periodically detected in groundwater at concentrations greater than NHDES' GW-2 Groundwater to Indoor Air Screening values in the northern portion of the Site, NHDES requires ongoing sampling of monitoring wells in this area (GZ-9U and MW-6). GZA's evaluation indicated that the on-Site Salem Animal Rescue League operations are not currently at risk from a vapor intrusion perspective.

[11] *Off-Site Vapor Intrusion Study and GMZ Evaluation*, prepared by GZA, dated February 24, 2015

3.0 SUMMARY OF PDI ACTIVITIES

Previous remedial activities completed at the Site have targeted areas downgradient from and near potential source areas and were technologies better suited for dissolved-phase impacts. Additional remedial measures are needed to address the continued presence of elevated levels of CVOCs in Site soil and groundwater, as well as the source-soil containing residual CVOC concentrations suggesting possible or probable DNAPL and the larger area containing Soil Remediation Standard (SRS) exceedances. The PDI was completed to collect additional data to facilitate selection of applicable remediation technologies for the Site. PDI activities, which were completed by Woodard & Curran, are summarized in the Sections below.

3.1 INVESTIGATION OBJECTIVES

The primary objectives of the PDI were to: 1) evaluate soil and groundwater quality in the vicinity of potential source areas to further define the extents of impact; and 2) collect data to evaluate remedial alternatives.

To facilitate data evaluation and refinement of the Conceptual Site Model (CSM), Woodard & Curran divided the Site into sub-areas, or Areas of Investigation (AOIs), to be targeted during the PDI. Woodard & Curran developed the AOIs considering Site history, investigation activities, and groundwater flow directions. AOIs are summarized in the table below and shown on Figures 2A to C.

Table A – Summary of AOIs

AOI #	Name / Description	Potential Source (s)	Rational for Investigation as Part of PDI
1	Former WWTF Area	• Former trickling filters • Former 200-gallon UST • Former sludge drying beds • Existing sewer line • Former treatment plant outfall	• Investigate potential sources • Evaluate potential for preferential migration through utility corridor

AOI #	Name / Description	Potential Source (s)	Rational for Investigation as Part of PDI
2	DNAPL Area	• Former sludge pits • Former northern soil pile • DNAPL Area • Former open channel • Existing sewer line	• Investigate potential sources • Evaluate extent of impacts and presence of DNAPL • Collect additional data for eastern portion of AOI (limited soil data available) • Evaluate potential for preferential migration through utility corridor
3	Other Potential Source Areas	• Former sludge pit • Former open channel • Former southern soil pile • Existing sewer line	• Evaluate potential sources • Evaluate potential for preferential migration through utility corridor
4	Undeveloped Upland Area	N/A	• Limited existing data available for this area
5	Wetland and River Area	• Treatment plant outfall	• Evaluate outfall as potential source • Additional characterization of extent of impacts in wetland
6	Upgradient Area	N/A	• Groundwater sampling of wells not typically sampled under GMP
7	Downgradient Area (outside of Groundwater Management Zone)	N/A	• Replacement of monitoring wells GZ-10U and GZ-10L

3.2 PDI ACTIVITIES COMPLETED BY WOODARD & CURRAN

Field activities were completed by Woodard & Curran and their subcontractors in June, July, August, and November 2019. GeoInsight's understanding is that the field work was generally completed in accordance with the PDI Work Plan, a copy of which is provided in Appendix B.

GeoInsight was provided with boring logs, analytical laboratory data reports, and limited field notes from the PDI, and has prepared the summary below based upon the information received. Woodard & Curran's field documentation is provided in Appendix D, and analytical laboratory data reports not provided in previous data transmittals are provided in Appendix E.

3.2.1 Soil Stockpile Sampling

Samples were collected from the current soil pile staged near the former WWTF structures to characterize the soil in anticipation of its re-use on-Site, specifically as backfill for the former WWTF subgrade structure. Woodard & Curran collected a total of four composite samples from the stockpile for laboratory analysis of total metals, total petroleum hydrocarbons, pesticides, PCBs, herbicides, CVOCs, and semi-VOCs (SVOCs), pH, total solids, ignitability, cyanide, and sulfide. Sample results are provided in Table 1, and photographs of the soil stockpile are provided in Appendix D. The analytical data indicates a suite of PAHs and metals commonly associated with asphalt, which is consistent with the observed presence of asphalt fragments in the stockpile. The data from the stockpile sampling, conclusions regarding impacts resulting from asphalt in the soil, and proposal for the planned reuse of the soil will be provided to NHDES in a separate submittal prior to the reuse of the soil.

3.2.2 Soil Borings and Soil Sampling

Soil borings were completed at 80 locations in AOIs #1 through #5, with most of the borings completed in AOIs #2 and #3 (designated as SB19-01 through SB-19-78, SB-68R, and SB19-UST). Borings were completed to depths ranging from 12 to 54 feet bgs using a Geoprobe® and/or spilt spoon sampler and drive and wash techniques, as indicated on the boring logs provided in Appendix D.

In addition, eight soil borings were completed using hand auger techniques along the former WWTF outfall and in the wetland area to the west of the former sludge drying beds (designated HSB-19-1 to HSB-19-8). Hand-auger borings were completed to depths of 4 to 7 feet bgs, and logs are provided in Appendix D.

The locations of the soil borings completed as part of the PDI are provided on Figure 2B. The surveyor's report for the soil borings and monitoring well locations (discussed below) is provided in Appendix D. Locations and elevations for the soil borings and monitoring wells installed during the PDI, as well as other monitoring wells previously installed at the Site, were surveyed relative to a New Hampshire State Plan Coordinate System of North American Datum (NAD 83) and the North American Vertical Datum (NAVD 88); previous surveys had been completed relative to an Site-specific datum.

A total of 116 soil samples, including duplicate samples for quality assurance / quality control (QA/QC) purposes, were collected from the soil borings for laboratory analysis. Five of the samples were collected from the LSU, 16 of the samples were collected from the SCU, and the remaining samples were collected from the USU. Most of the samples were submitted for analysis of CVOCs, and a small subset of these samples were also submitted for analysis of Gasoline Range Organics (GRO) and Diesel Range Organics (DRO); the remaining samples were submitted for analysis of total organic carbon (TOC) and grain size. Soil analytical results from the boring locations are provided in Table 2, and analytical laboratory data reports are provided in Appendix E.

3.2.3 Monitoring Well Installation

As part of the PDI, monitoring wells were re-installed at GZ-10LR and GZ-10UR, which were previously destroyed. Thirteen additional monitoring wells were also installed as part of the PDI in AOI #1 through #5, at locations where soil borings were also completed (see description above). Monitoring wells were installed in both the upper hydrogeologic unit (designated as MW19-01U to MW19-05U and UW19-01U to UW19-06U) and the lower hydrogeologic unit (designated as MW19-02L and MW19-06L). Based upon GeoInsight's review of the monitoring well construction logs provided in Appendix D.2, two of the upper hydrogeologic unit monitoring wells appear to be at least partially installed in the SCU that separates the upper and lower hydrogeologic units (MW19-03U MW19-04U). Monitoring well construction details for

the wells installed as part of the PDI, as well as select monitoring wells previously installed at the Site, are provided in Table 3.

In addition, three 1-inch diameter piezometers were installed in the wetland areas in AOI #5 and designated as PZ-19-2, PZ-19-6, and PZ-19-7. Information about the installation of these piezometers is provided in Appendix D.

3.2.4 Groundwater Gauging and Sampling

Groundwater monitoring was conducted in June and November 2019 by Woodard & Curran in accordance with the requirements of the GMP. These monitoring events also included sample collection at three surface water locations (SW-1, SW-2, and SG-902) during the November 2019 round, as required by the GMP. Samples were collected from 27 and 38 locations for the June and November 2019 rounds, respectively. Samples were submitted for laboratory analysis of VOCs, low-level 1,4-dioxane, and/or or PCBs, as required under the GMP. In addition, samples were also collected from 18 wells in June and July 2019 for analysis of PFAS. Analytical laboratory data reports for these sample rounds were provided in previous data transmittals to NHDES[12]. Field documentation for these monitoring rounds is provided in Appendix D.

Woodard & Curran completed a supplemental monitoring round in August 2019 of monitoring wells installed as part of the PDI, as well as select monitoring wells not routinely sampled as part of the GMP, for a total of 41 wells. Analytical laboratory data reports are provided in Appendix E. Woodard & Curran's field documentation for the monitoring rounds is provided in Appendix D.

Water level measurements and corresponding groundwater elevations for the three monitoring rounds are provided in Table 4, and analytical results from the groundwater and surface water

[12] *Results from November 2019 Water Quality Program Monitoring*, prepared by Woodard and Curran, dated December 31, 2019 and *Results from June 2019 Water Quality Program Monitoring*, prepared by Woodard and Curran, dated August 16, 2019.

samples collected in 2019 and recent monitoring rounds are provided in Tables 5 and 6, respectively. GeoInsight completed the June 2020 GMP monitoring event and the data was provided in a GMP data transmittal, submitted to the NHDES on August 8, 2020. The June 2020 data will be further summarized in the forthcoming GMP Renewal Report and again (along with the November 2020 GMP data) in a 2021 Periodic Summary Report.

4.0 FINDINGS AND DISCUSSION

GeoInsight reviewed the data from the PDI activities in conjunction with data collected during previous Site investigations. GeoInsight's findings regarding the nature and extent of impacts in the various Site media, and an updated CSM are presented in the Sections below. The AOIs designated by Woodard & Curran are retained for this discussion to the extent that they help focus and guide GeoInsight's recommendations for areas to be addressed through additional remedial actions.

4.1 GROUNDWATER FLOW

Groundwater flow across the Site is generally towards the Spicket River. In June and November 2019 (Figure 3), groundwater in the upper hydrogeologic unit in the southern portion of the property flowed to the southwest to west towards the Spicket River, and groundwater in north part of the Site generally flowed to the west towards the Spicket River. A localized area of flow from the river back towards the Site was noted near monitoring well GZ-901U during the June 2019 event and appears to be inconsistent with previous monitoring events at the Site. In June 2019, a water table high area was present near wells GZ-2 to GZ-609U. In November 2019, the water table was highest near well GZ-802US and lowest at GZ-2, with a second localized high near GZ-9U. Groundwater flow in the lower hydrogeologic unit was generally towards the north and west towards the Spicket River; however, a localized area of flow towards the northeast was noted in the northeastern part of the Site during the 2019 monitoring events, also inconsistent with previous monitoring rounds.

Vertical gradients vary across the Site. Of note, vertical gradients in the main source area in AOI #2 are generally downward (see GZ-609U/L), from the upper hydrogeologic unit to the lower hydrogeologic unit. Vertical gradients in more downgradient areas are generally upward (see GZ-902L/M, GZ-1S/D, GZ-404U/L). However, a downward gradient was noted in the couplet at GZ-901 for the June 2019 monitoring round, which is inconsistent with previous monitoring rounds.

The difference in the 2019 groundwater flow directions could potentially be due to an error in the elevation survey, which was completed in 2019 as part of the PDI activities, or that groundwater level measurements were not recorded simultaneously, but over the course of several days of sampling. GeoInsight will continue to evaluate groundwater flow conditions as part of upcoming GMP monitoring events and will gauge GMP wells within the same day during each event.

4.2 NATURE AND EXTENT OF VOC IMPACTS

4.2.1 Groundwater and Surface Water

Analytical results from the groundwater and surface water samples collected in 2019 and recent monitoring rounds are provided in Tables 5 and 6, respectively. Additional historical analytical results for groundwater and surface water are provided in Appendix C.

The primary COCs in Site groundwater are CVOCs, including PCE, TCE, cis-and trans-1,2-DCE, and VC, which were detected in both upper and lower hydrogeologic unit groundwater at concentrations exceeding their respective AGQSs.

The extents of AGQS exceedances of TCE and cis-1,2-DCE in upper and lower hydrogeologic unit groundwater are presented on Figures 4A, B, C, and D. The extent of TCE in groundwater is widespread across the Site, with concentrations higher near source areas (as described below), and exceedances extending into downgradient areas near the Spicket River. In addition, the extent of cis-1,2-DCE (and VC) is more widespread than that of TCE in both units (see Section 4.4, Updated CSM, for an explanation of the difference in extents of TCE versus cis-1,2-DCE and VC).

In addition, several petroleum-related and other VOCs were detected at concentrations greater than their respective AGQSs, including 1,4-dioxane, benzene, ethylbenzene, methyl tert-butyl ether (MtBE), tert-butyl alcohol (TBA), and toluene. In general, these constituents were detected proximate to the source areas, with the exceptions of 1,4-dioxane, MtBE, and TBA, which were

detected in downgradient areas in the southern and western portions of the Site. A more detailed discussion of groundwater concentrations is provided below in the summary for each AOI.

During the November 2019 monitoring round, TCE was detected at concentration less than its WQCTS in the sample collected from surface water sampling location SG-902, in the northern part of the Site, near the GZ-902 well series; cis-1,2-DCE was also detected at this location. TCE was detected at a concentration less than its WQCTS in the sample from SW-1, and cis-1,2-DCE was at a low-level in the sample collected from location SW-2. These data are generally consistent with previous surface water sampling events at these locations.

4.2.2 Soil

Analytical results for soil samples collected during the PDI are provided in Table 2, and soil analytical results from previous investigations completed at the Site are provided in Appendix C.

CVOCs, including PCE, TCE, cis-1,2-DCE, and VC, were detected in soil at concentrations greater than their respective SRSs in samples collected as part of the PDI. In addition, several other CVOCs were detected at concentrations greater their respective SRSs, including methylene chloride, naphthalene, 1,2-dichlorobenzene, 1,4-dichlorobenzene, and toluene. Benzene was also detected above its SRS in several samples collected during the MIP investigation.

SRS exceedances were detected in samples collected above and below the water table. The extent of SRS exceedances for TCE are shown on Figure 5 by depth, from 0 to 7 feet bgs (generally above the seasonal water table), 7 to 15 feet bgs, greater than 15 feet bgs within the upper hydrogeologic unit, and within the SCU. Data collected from previous investigations was used to evaluate the extent of exceedances shown on the Figure. In general, the extent of TCE exceedances in soil is most widespread in the 7 to 15 feet bgs interval, below the water table.

A more detailed discussion of soil concentrations is provided below in the summary for each AOI.

4.2.3 Estimated Pore Water Concentrations

During field work in 2014, GZA observed DNAPL at well GZ-TW-1L, which is screened in the upper hydrogeologic unit in the primary source area. GZA observed DNAPL at this location on several occasions in 2014 and 2015 at thicknesses ranging from 0.04 to 0.25 feet. DNAPL was reportedly not observed at this location after this time.

According to the United States Environmental Protection Agency (USEPA) 1992 publication[13] titled "Estimating Potential Occurrence of DNAPL at Superfund Sites," DNAPL is potentially present at sites where dissolved concentrations of a DNAPL-related chemical in groundwater is greater than 1 percent of the chemical's pure phase solubility limit. To ascertain the distribution of potential DNAPL-impacted soils at the Site, dissolved phase or "pore water" concentrations of TCE were calculated from analytical laboratory results for soil samples and compared to the pure phase solubility limit of TCE (1,075 milligrams per liter [mg/L][14]). Data for soil samples collected during the PDI and prior investigations at the Site were used for this calculation along with estimated representative values for soil bulk density and soil organic carbon data from analytical testing.

The pore water concentration calculation, presented by Cohan and Mercer, was developed by Ross and Newall and was based upon relationships developed by Feenstra and Cherry[15]. The relationships assume that if DNAPL is not visually observed at a given location (i.e., present in separate-phase in soil pores), then CVOCs present must be dissolved in the groundwater phase and DNAPL must be adsorbed onto soil. If pore water concentrations calculated from soil data

[13] Ross, Randall R. and Newell, C.J., 1992. Estimating Potential for Occurrence of DNAPL at Superfund Sites. USEPA Publication 9355.4-07FS.

[14] 1,075 mg/L is the average of TCE pure phase solubility in water from: Chemical Properties Handbook, Yaws, 1999; Groundwater Chemicals Desk Reference, Montgomery, 2000; DNAPL Site Evaluation, Cohen & Mercer, 1993.

[15] Feenstra, S. and Cherry, J.A., 1988. Subsurface Contamination by Dense Non-aqueous Phase Liquid (DNAPL) Chemicals. In *Proceedings*: International Ground water Symposium, International Association of Hydrogeologists, May 1-4, 1988, Halifax, Nova Scotia, pp. 62-69.

are greater than the effective solubility of a constituent of interest, then the presence of DNAPL is indicated. Pore water concentrations were calculated using the equation:

$$C_w = (C_t * B_d) / (K_d * B_d + n_w)$$

where:

C_w = calculated pore water concentration;

C_t = concentration of VOCs in soil (in this case, taken from TCE concentrations measured in soil samples completed during the PDI and previous Site investigations and summarized in Table 7);

B_d = bulk density for all units = 1.5 grams per cubic centimeter (in this case, taken from a mean of literature values in Bowles 1982);

n_w = water-filled porosity = 0.35 (obtained from literature values, including Fetter 1994); and

K_d = sorption partitioning coefficient calculated using the following equation (Fetter 1999).

$$K_d = K_{oc} * F_{oc}$$

where:

K_{oc} = organic carbon partitioning coefficient for TCE = 129 L/kg (from the same three sources cited for the TCE solubility limit); and

F_{oc} = fraction of organic carbon from TOC analytical data (Table 7). The carbon mass associated with the VOCs was assumed to be negligible.

Calculated pore water concentrations, summarized in Table 7, indicate that pore water concentrations were highest in samples collected from MIP-4, MIP-35, and MIP-50, which were collected in the USU with calculated TCE porewater concentrations that were between 900 and 13,000 percent of the TCE solubility (Table 7). It should be noted that relatively small changes in certain variables in the calculation, particularly porosity, resulted in relatively large changes in calculated pore water concentrations; however, one value (0.35) for porosity was used for pore water solubility calculations to reduce bias from that parameter. For these reasons, calculated pore water concentrations were used in this evaluation as a screening tool.

Calculated TCE concentrations in pore water varied from less than 1 percent to greater than 12,000 percent of the estimated pure-phase solubility of TCE (1,075 mg/L). Concentrations greater than 10 percent of the pure phase solubility limit are considered source indicator concentrations for the purposes of this evaluation. Soils containing TCE at concentrations above these indicator concentrations are considered potential source area soils, which are likely to contribute to dissolved TCE concentrations in groundwater. The lateral extent of TCE detected in saturated soils at concentrations greater than the 10 percent solubility limit are provided on Figure 5 and individual boring/soil sample locations are denoted on the same plan as >100% of the solubility (DNAPL "definite"); 50 to 100% of the solubility (DNAPL "probable"); and 10 to 50% of the solubility (DNAPL "possible").

4.2.4 DNAPL/Source-Soil and SRS Exceedance Areas and Soil Volumes

The total estimated volume of DNAPL-impacted soil, as indicated by pore water concentrations above 10% of TCE solubility provided on Figure 5, is provided below together with estimated areas of SRS exceedances

Soil Depth	**0-7'**	**7-15'**	**>15'-25'**
Estimated volume of soil with TCE SRS exceedance (ft^3 | cubic yards [CY])	69,000 | 2,600	225,000 | 8,400 *	197,000 | 7,300*
Estimated volume of soil with 10% TCE solubility (ft^3 | CY)	Not Applicable	43,000 | 1,600	6,500 | 250

*the SRS volume estimates also include the smaller sub-areas of TCE >10% of the solubility volumes

GeoInsight will prepare additional soil impact plans and cross-sections, which will present the estimated limits of DNAPL-source soil using iso-contours for the porewater concentration categories (>100%, 50 to 100%, and 10 to 50% of the solubility of TCE) and TCE soil sample analytical data concentrations for presentation in the forthcoming remedial bid specifications and remedial design plans. The limits of TCE SRS exceedances and the limits of pore water with calculated TCE concentrations >10% of the solubility presented on Figures 5, 6A, and 6B and

the soil volume estimates presented in the preceding table were sufficient for the purposes of remedial technology screening summarized later in this report.

4.3 KEY FINDINGS BY AOI

A summary of key findings from the PDI for each of the AOIs is provided below.

AOI #1: Former WWTF Area

Key Observations

- **Based upon a review of data collected from the PDI and from previous investigations, significant sources of VOCs have not been identified relative to the former WWTF structures.**
    - VOCs were detected at low levels, if at all, in soil samples collected during the PDI from the vicinity of the WWTF structures. In addition, observations of impacts were not noted in boring logs from the PDI (e.g., elevated PID readings, visual or olfactory observations) in this area.
    - Petroleum-related constituents were not detected in soil samples collected from the vicinity of the former UST located adjacent to the former WWTF, although we note that these samples were collected from below the water table.
    - Limited soil data were collected from this AOI previously, but included an exceedance of cis-1,2-DCE in a soil sample collected from 7 to 9 feet bgs from SB-4, which was completed in one of the former sludge beds during a 2002 investigation, and attributed to migration in groundwater from upgradient sources by previous consultants.
    - Elevated photoionization detector (PID) readings and observations of odors are noted on the boring log for well GZ-616U at depths from 10 to 22 feet bgs, suggestive of impacts below the water table. Samples were not collected from this location for laboratory analysis. Elevated PID readings and odors were not noted on boring logs for wells GZ-620U and GZ-202L, located northwest and northeast of GZ-616U, suggesting that the impact at GZ-616U is not extensive and is present only below the water table, and most likely the result of migration from upgradient sources, as discussed below.

- **VOC groundwater impacts in this AOI are most likely the result of migration from upgradient sources in AOIs #2 and #3.**
    - The extents of impacts in the upper hydrogeologic unit of AOC #1 appear more limited to the area immediately downgradient from AOI #2, with more widespread detections in the samples collected from lower hydrogeologic unit wells.
    - CVOCs were detected at high levels, greater than AGQSs, in the upper hydrogeologic unit groundwater at the upgradient edge of AOI #1 at GZ-616U,

where TCE was detected at a concentration of 28,000 micrograms per liter (µg/L) and cis,1-2-DCE was detected at 5,200 µg/L. This well is not routinely sampled under the GMP. Well GZ-9U, located to the northwest of the former sludge drying beds, has had periodic detections and exceedances of AGQS for VC.
    - Lower unit wells GZ-9L, GZ-201L, GZ-202L, and GZ-203L had exceedances of TCE, cis-1,2-DCE, and VC.

GeoInsight Recommendations

- Active remediation is not warranted at this time based upon these results. Natural attenuation of the dissolved phase impacts in AOI #1 is anticipated to occur following remediation in other AOIs.
- Continue to monitor groundwater quality through ongoing sampling of select wells in this AOI.

AOI #2: DNAPL Source Area

Key Observations

- **Data from the PDI and previous investigations suggests a residual source mass of VOCs in AOIs # 2 and #3, which appear to correspond to the locations of the former open channel, former sludge pits, and northern former soil pile.**
    - In addition to the historical observation of DNAPL at GZ-TW-1L, TCE soil concentrations at several locations are suggestive of the presence of DNAPL, as shown on the TCE distribution in soil figure provided as Figure 5, and on the cross-sections provided as Figures 6A and 6B.
    - The highest concentrations of TCE were detected in samples collected during the previously completed MIP investigation and included detections of 2,230 milligrams per kilogram (mg/kg), 5,570 mg/kg, and 31,200 mg/kg in samples from MIP-50, MIP-4, and MIP-35, respectively. Samples collected during the PDI had TCE concentrations as high as 150 mg/kg (boring SB19-64).
    - Multiple CVOCs were detected at concentrations greater than SRSs, including PCE, TCE, cis,1-2-DCE, and VC.
    - Other VOCs were detected in soil, including benzene and toluene, which were detected at concentrations greater than their respective SRSs in borings completed during the PDI and MIP investigations. The co-occurrence with exceedances of TCE suggests these constituents originated from the same source, rather than a separate source.
    - The highest soil concentrations are present in the area at the northern end of the former open channel / sludge pit and northern former soil pile, suggesting the primary source(s) are located in this area. TCE impacts then continue to the south along approximately half of the length of the former open channel in shallow soil above the water table. High levels of TCE in soil in the former channel generally correspond to the observance of a peat-like, organic layer, as shown on the cross-sections provided as Figures 6A and 6B. TCE impacts also extend to the north,

below the water table, and appear to extend slightly into AOI #1 in soils below the water table. In the main source area near GZ-TW-1L/GZ-802U/D/MIP-4, impacts are more laterally connected, and moving north, impacts appear to be present in several apparently isolated masses, as shown on the cross-section lines B-B' and C-C' on Figure 6B. We note that other constituents, including cis-1,2-DCE and VC were also detected at concentrations greater than SRSs in these areas.

- **Groundwater in both the upper and lower hydrogeologic units is highly impacted, with higher concentrations in the upper hydrogeologic unit.**
    - TCE was detected in groundwater at concentrations up to 200,000 µg/L in the sample collected from GZ-TW-1L, which is screened in the lower part of the upper hydrogeologic unit, despite its nomenclature.
    - Other CVOCs, including PCE, cis-1,2-DCE, TCA, and VC, as well as other VOCs, including naphthalene, MtBE, 1,-4-dioxane, toluene, and benzene were detected in groundwater at concentrations exceeding their respective AGQS.
    - In general, TCE concentrations in lower unit groundwater are an order of magnitude lower than those detected in the upper unit.

GeoInsight Conclusions and Recommendations

- Historical features (i.e., northern former soil pile and sludge pits) in this area appear to be primary source areas for the CVOC impacts observed across the Site in downgradient areas. Active remediation is warranted, as discussed in more detail below.

AOI #3: DNAPL Source Area

- **Data from the PDI suggests that the former open channel is a source of shallow soil impacts.**
    - Exceedances of the SRS for TCE in shallow soil extend approximately halfway along the length of the former channel, as depicted on cross-section A-A' shown on Figure 6A.
    - Soil with calculated pore water concentrations greater than 10 percent of the solubility of DNAPL extends to the west of the former channel in some areas, suggesting the possible presence of DNAPL in these areas depicted on Figure 5.
    - The southern former soil pile does not appear to be an ongoing source of TCE impacts. Although, cis-1,2-DCE and VC were detected above SRSs in soil samples collected at depth in the vicinity of this former pile.

- **VOC concentrations in groundwater in AOI #3 are lower than those detected in groundwater in AOI #2.**
    - TCE is present in groundwater, but generally at concentrations less than AGQS, while cis-1,2-DCE and VC are present at concentrations greater than AGQSs in both upper and lower hydrogeologic unit groundwater.

- MtBE and 1,4-dioxane were detected in groundwater at concentrations greater than AGQSs.

GeoInsight Conclusions and Recommendations

- The former open channel and sludge pits appear to be a primary source area for the CVOC impacts observed across the Site in downgradient areas.
- Active remediation is warranted, as discussed in more detail below.

AOI #4: Undeveloped Upland Area

Key Observations

- **Impacts not identified.**
  - VOCs were not detected in soil.
  - Observations of impacts were not noted in boring logs from PDI (e.g., elevated PID readings, visual or olfactory observations indicative of impacts, were not noted).
  - VOCs were not identified in groundwater.

GeoInsight Recommendations

- Active remediation is not warranted at this time based upon these results.

AOI #5: Wetland and River Area

Key Observations

- **Based upon data collected during the PDI, a notable source of VOCs was not identified in soil located in AOI #5.**
  - VOCs were detected at levels, less than their SRSs in soil samples collected from the vicinity of the former wastewater outfall discharge line (HSB locations) during the PDI.
  - VOCs were detected at levels, less than their SRSs in soil samples collected from other locations in this AOI during the PDI.
  - Observations of impacts were not noted in boring logs from the PDI (e.g., elevated PID readings, visual or olfactory observations were not observed).
  - Limited soil data are available from previous investigations. An exceedance of the SRS for TCE in a soil sample from 20 to 22 feet was detected at MW-1, which was installed in 2002. An exceedance of cis-1,2-DCE in a shallow soil (approximately 0.5 feet bgs) was detected in a sample collected near SW-6, which is a seasonally wet former meander channel of the Spicket River. These data are provided in Appendix C.

- **Groundwater impacts are the result of migration from upgradient source areas.**
    - Well UW19-01, installed as part of the PDI, helped to delineate the extent of groundwater impacts in the northwestern portion of the Site.
    - The extent of impacts in the USU are more limited, with more widespread detections in LSU wells.
    - Concentrations are highest in wells immediately downgradient from source areas in AOIs #2 and #3 (e.g., MW-1U/D) and wells near the Spicket River (GZ-900 series, and newly installed UW19-01U). AGQS exceedances of CVOCs, including TCE, cis,1-2-DCE, and VC, were detected.
    - AGQS exceedances of MtBE, TBA, and 1,4-dioxane were detected.
    - The GMP requires sampling at three surface water locations – SW-1, SW-2, and SG-902 in November each year. Site-related VOCs have been detected periodically at low levels in samples from these locations, at concentrations less than NHDES surface water quality criteria.
    - CVOCs have historically been detected at surface water location SW-6, which is located in a seasonally wet former meander channel of the Spicket River that is located downgradient from AOI #3. Exceedances of surface water quality criteria in samples from this location were detected as recently as 2015, when this location was last sampled. These data are provided in Appendix C.

GeoInsight Conclusions and Recommendations

- Active remediation is not warranted at this time based upon these results.
- Continue to monitor groundwater and surface water quality through select sampling of key wells and surface water locations.

AOI #6: Upgradient Area

Key Observations

- Soil samples were not collected as part of the PDI. Based upon our review, soil data were not collected from this area historically in the investigations completed by GZA, as sources were not suspected in this portion of the Site.
- VOCs were not detected in groundwater in this AOI.

GeoInsight Recommendation

- Active remediation is not warranted at this time based upon these results.

AOI #7: Downgradient Area (outside of Groundwater Management Zone)

Key Observations

- Soil samples were not collected from this area as part of the PDI. Based upon our review, soil data were not collected from this area historically in the investigations completed by GZA, as sources were not suspected in this area.
- VOCs were not detected in groundwater in upper unit wells.
- Site-related VOCs have typically not been detected in groundwater samples collected from monitoring wells on the west side of the Spicket River (GZ-10U/L, GZ-905U/L, GZ-903U, GZ-904U), with the following exceptions.
  - A sample collected from replacement well GZ-10LR in November 2019 had a detection of MtBE greater than AGQS, and detections of TCE, cis-1,2-DCE, and trans-1,2-DCE less than AGQSs. This well also had a low-level detection of MtBE in June 2019 when it was sampled for the first time. Previously, these compounds had not been detected in samples collected from GZ-10L (the older well).
  - Well GZ-905L has had detections of PCE, TCE, and cis-1,2-DCE at levels less than AGQS in five out of the ten rounds it has been sampled (ranging from 0.77 to 2.6 mg/L).

GeoInsight Conclusions and Recommendations

- Groundwater test results at GZ-10LR are inconsistent with previous sampling events. GMP sampling of monitoring well GZ-10LR in June 2020 indicated significant reductions in MtBE and cis-DCE, and TCE was not detected. This well will continue to be sampled in June and November of each year as part of GMP sampling events.
- Active remediation is not warranted at this time based upon these results.
- Continue to monitor groundwater quality through ongoing sampling of select wells in this AOI.

4.4 UPDATED CONCEPTUAL SITE MODEL

The updated CSM presented below is based upon GeoInsight's review of information collected during the PDI and previous reports prepared for the Site by others. Based upon the elevated soil and groundwater concentrations and historical observations of DNAPL, VOCs appear to have been released in and around the vicinity of the former open channel, former sludge pits, and northern and southern former soil piles in AOIs #2 and #3.

As documented in previous reports prepared by GZA, illicit disposal of industrial septage by septage haulers or others is thought to have occurred at the Site, potentially via the previously

unrestricted access to the Site from Garabedian Drive to the south. VOCs appear to have also been contributed from the disposal of impacted treatment media in the sludge pits, in particular the pit that correlates with the northern portion of the former open channel. Elevated VOC concentrations (up to 10,800 mg/kg of TCE at MIP-35) were detected in soils above the water table along approximately half of the former open channel. The elevated concentrations were identified in the "peat"-like, organic rich layer observed in borings completed within this feature. Based upon observations of historical aerial photographs provided in the PDI Work Plan, the former open channel appears to have been filled in over a number of years. In addition, during installation of the sewer line, visibly impacted soils were removed and stockpiled in the northern and southern former soil piles, contributing to the observed distribution of VOCs.

Due to its density greater than water, DNAPL would have migrated downward into the upper hydrogeologic unit below the water table. The resulting pattern of distribution of VOCs in the subsurface is controlled by the interbedded nature of the Site soils and absorption of TCE onto finer-grained soils. DNAPL migration would have occurred downward via the path of least resistance (sandy soils) and impeded or redirected upon encountering strata of the finer-grained soils. DNAPL migration through the SCU would be significantly impeded because of the displacement pressure necessary to move water from the pore spaces between the silt and clay particles. As a result, where present in significant enough quantities, DNAPL could pool on the SCU surface.

Although only directly observed at one well (GZ-TW-1L), DNAPL is likely present in areas within and west of the former open channel and north of the northern former soil pile based upon the elevated TCE concentrations detected in soil below the water table (up to 31,200 mg/kg at location MIP-35) and the pore water solubility calculations performed, as presented in Section 4.2.3 and as shown on Figure 5. These areas are larger than those previously inferred to be present based upon prior investigations by others.

CVOCs, including TCE, cis-1,2-DCE, and VC, are present in soil and groundwater in the source areas, in addition to other VOCs, including petroleum-related VOCs such as benzene and

toluene, as well as naphthalene and trimethylbenzene in soil. The co-occurrence of the CVOCs and other VOCs suggests a similar/co-mingled source, rather than a separate petroleum-related source (consistent with co-mingled industrial septage loads likely discharged on-Site). MtBE and TBA are largely not present at elevated levels in the source area, but have moved to downgradient areas in groundwater, at concentrations greater than their respective AGQSs.

TCE is present at concentrations greater than SRS in the upper hydrogeologic unit at depth, as shown on Figure 5. Exceedances of VC and cis-1,2-DCE are also noted in soils below the water table and appear more laterally widespread than those of TCE. GeoInsight believes the wider extent of the cis-1,2-DCE and VC in groundwater is likely a function of the production of these daughter products from the ERD of the parent compound TCE in the source areas. Also, ERD may be stopping at the sulfate-reducing stage, which would accumulate cis-1,2-DCE and VC in groundwater. Lastly, the soil organic carbon-water partitioning coefficient (K_{oc}) is higher for TCE than it is for cis-1,2-DCE and VC; therefore, those compounds would be expected to migrate farther in the aquifer than TCE.

Based upon the limited soil data for the SCU, the extent of impacts within the SCU is not well understood, but VOCs appear to be present in at least the upper portion of this unit.

- A soil sample collected from what appears to be the top of the SCU from MIP-4 had an exceedance of TCE.
- Soil samples collected from the SCU at locations MIP-13, SB19-40, and SB19-59 had exceedances for VC and cis-1,2-DCE, although TCE was not detected.
- At borings SB19-49, SB19-58, and UW19-06U, samples from within the SCU were not collected for laboratory analysis; however, elevated PID and odors were noted during drilling near the bottom of the borings, which were completed in the upper portion of the SCU.
- At borings SB19-60 and SB19-70, samples from within the SCU were not collected for laboratory analysis, but elevated PID and odors were observed during drilling in the upper couple of feet of the silty clay layer and decreased with depth.

The presence of TCE impacts in the upper portion of the SCU is consistent with the likely historical pooling of DNAPL on top of the SCU after downward migration through more

permeable soil of the USU. VOCs, and possibly small amounts of DNAPL via displacement, likely diffused into the pore water of the upper portion of the fine-grained SCU.

From the source areas, VOCs migrated into groundwater and spread downgradient, resulting in a large area of impacted groundwater in both upper and lower hydrogeologic units across the Site. VOCs are present in groundwater at concentrations greater than AGQSs in both the upper and lower hydrogeological units, indicating that the SCU has not completely prevented the migration of impacts and/or that groundwater has migrated into the lower unit in areas where the SCU is absent. It is also possible that VOCs may have been introduced to the lower unit during previous installation of wells in this unit by others (as discussed below). Vertical gradients in source area wells are generally downward; whereas gradients in the areas near the river are generally upward, suggesting migration of impacted groundwater in the lower hydrogeologic unit, and discharge into the upper hydrogeologic unit near the Spicket River.

In addition to the hydrogeologic controls on VOC distribution in groundwater, GeoInsight notes potential smearing of impacted soils and physical transport of possible DNAPL-containing soil below the water table during installation of wells in the lower hydrogeologic unit. Higher TCE concentrations were detected in wells GZ-3A, GZ-3L, and GZ-4L located outside the area targeted by the ERD program either immediately following their installation or within two years after installation, with TCE concentrations ranging from 12,000 to 58,000 µg/L. In addition, TCE concentrations in these wells rapidly declined to pre-injection levels (maximum of 300 µg/L), despite being located outside of the area of influence of the injections. This decrease may be an indication that impacted soils from shallower zones were smeared along the borehole wall and provided a short-term source for CVOCs dissolved in groundwater.

In addition, historical CVOC concentrations in lower hydrogeologic unit at well GZ-505L and replacement well GZ-505LR are two to three orders of magnitude higher than those in nearby wells screened within the same unit. GZ-505L was installed in 2006, and groundwater samples from this well showed a 300-fold increase in TCE concentrations until it was over-drilled and grouted in 2012. The original well construction appears to have introduced CVOCs to the lower

aquifer in this area at concentrations indicative of DNAPL. CVOC concentrations in replacement well GZ 505LR appeared to have decreased over time, although they are still highly variable. It is also noted that TCE concentrations increased in lower unit wells GZ 403L and GZ-405L following their installation.

The limited data available suggests that VOCs in bedrock groundwater, where present, are limited. VOCs in samples collected from well GZ-3B, when detected, have been detected at generally low levels (single digit µg/L) and during recent monitoring events, have included 1,1-DCE and MtBE at concentrations less than their respective AGQSs. In addition, 1,4-dioxane has been detected greater than its AGQS in several samples collected since 2010 but was not detected (reporting limit of 0.25 µg/L) in the most recent sample collected from June 2020. VOC detections in lower hydrogeologic unit groundwater at GZ-3L are one to two orders of magnitude greater than those in GZ-3B (with the exception of 1,4-dioxane, which has been detected at similar concentrations), at concentrations greater than AGQSs. An upward gradient measured in at GZ-3B/GZ-3L suggests that downward transport of VOCs from the lower hydrogeologic unit in this area is limited. VOC samples results for upgradient well GZ-1B were not available in the documents reviewed by GeoInsight.

Groundwater elevation data, surface water analytical data, and sediment pore water analytical data suggest that site-related VOCs can be transported upward and discharged into the Spicket River in the dissolved-phase. Surface water sampling within the river has indicated that concentrations are less than water quality criteria. (Note that some of the 2019 groundwater elevation data are inconsistent with previous data and suggest that in some locations the river is discharging to groundwater. GeoInsight will further evaluate these conditions as part of the evaluation of data from the 2020 GMP monitoring rounds to be presented in the Periodic Summary Report to be submitted in January 2021).

4.5 UPDATED SENSITIVE RECEPTOR SURVEY

Previous sensitive receptor information is summarized in Section 2.7. Of related significance are potential discharges of Site COCs to the Spicket River and the potential for vapor intrusion of

Site VOCs into on-Site structures (i.e., Salem Animal Rescue League buildings) and off-Site residential structures, located beyond the west bank of the Spicket River. As discussed, the Spicket River is a discharge point for Site groundwater, in particular from upper hydrogeologic unit groundwater. As discussed in Section 2.7, GZA's 2017 Periodic Summary Report includes the results and conclusions regarding their evaluation of VOC discharge to the Spicket River, which included sediment pore water sampling from six sample locations.

Groundwater and surface water sampling completed since the pore water sampling evaluation indicate stable or decreasing VOC concentrations in groundwater and surface water samples near the river. Post-2014 groundwater sampling of monitoring wells GZ-901U/L, GZ-902U/L GZ-903U, GZ-904U, and GZ-905L located on- and off-Site in close proximity to the river showed one or more VOCs detected in four wells (GZ-901U, GZ-901L, GZ-902U, and GZ-905L). Groundwater sampling in 2019 showed moderate to significant VOC reductions in each of the four monitoring wells since 2014 (Table 5). Surface water sampling completed as part of GMP monitoring show periodic detections of TCE and cis-DCE in the three surface water stations (SG-902, SW-1, and SW-2) at concentrations below WQCTS, Fresh Chronic Criteria and AGQSs (Table 6). Although the concentrations were low, the November 2019 results represent the first detection of TCE at SW-1 and TCE and cis-DCE at SG-902. Continued monitoring of surface water stations is warranted; however, a significant threat to the river water quality on-Site and downstream is not evident based upon the available data.

Groundwater data from the PDI are generally consistent with historical detections in groundwater. Continued monitoring at wells GZ-9U and MW-6 near the Salem Animal Rescue League buildings is warranted, given exceedances of GW-2 screening values in other wells in the northern portion of the Site. In addition, potential future redevelopment at the Site should consider a further evaluation of the groundwater-to-indoor air pathway, given the elevated concentrations of VOCs in Site soil and groundwater.

As previously reported in GeoInsight's Groundwater Monitoring Data Transmittal – June 2020, dated August 6, 2020, the NHDES requested updated potential receptor information due to a

detection of 26 µg/L of MtBE in replacement monitoring well GZ-10LR, located on the west side of the Spicket River, during the November 11, 2019 sample event. TCE and cis-DCE were also detected in the GZ-10LR sample collected in November for the first time or at elevated concentrations compared to historical results. Based upon information obtained from the Town Municipal Services Division, public water is supplied to properties within 500 feet of monitoring well GZ-10LR and water supply wells were not identified within that radius. GMP sampling of monitoring well GZ-10LR in June 2020 indicated significant reductions in MtBE (less than AGQS) and cis-DCE, and TCE were not detected.

Based upon current information, Site COCs do not appear to represent a threat to receptors from soil vapor or drinking water ingestion pathways.

5.0 REMEDIAL ACTION PLAN ADDENDUM

5.1 SCREENING OF REMEDIAL ALTERNATIVES

Despite many years of remediation, Site groundwater quality has not improved significantly. Although ERD injections were generally effective in treating the comparatively low CVOC concentrations within the injection radius of influence, upgradient source impacts remained untreated and continue to provide a source for dissolved-phase CVOCs that likely migrated into the treated areas and re-impacted these areas. As such, active remediation in source areas is proposed, as described below.

In consultation with the Town, the following remedial objectives were established for active remediation at the Site.

1. Remediate soil and groundwater so the property can be reused by the Town or sold for redevelopment with limited restrictions on reuse.
2. Complete active remediation in less than five years.
3. Transition to a manageable and predictable long-term groundwater monitoring program following active remediation.

Based upon the information summarized herein, GeoInsight recommends a remedial strategy that removes COC sources from saturated and unsaturated zone soils. A COC source is defined herein as soils with an estimated pore water concentration greater than 10% of the pure phase solubility limit of TCE (as described in Section 4.2). In addition, to achieve transition to a manageable and predictable long-term monitoring program within a reasonable timeframe (i.e., less than five years) and reduce the need for Activity and Use Restrictions (AURs) following remediation, soils containing TCE at concentrations exceeding the SRS of 0.8 mg/kg should be remediated to concentrations below the SRS.

The selected technology should also remove or reduce non-TCE COCs to concentrations that will achieve the active remediation objectives. The Town's desire to remediate the Site such that remaining soil COCs are below SRSs will require a much larger remediation program than addressing the COC source soil alone. GeoInsight evaluated costs and approach to remediate

DNAPL source areas plus the larger area of SRS exceedance and the DNAPL source areas only. The proposed remedial action will also reduce the potential for indoor air exposure through the anticipated reduction in groundwater concentrations in downgradient areas. Treatment of highly impacted soils above the water table will also eliminate the direct contact exposure pathway.

AOIs #2 and #3 contain soils that will be targeted for active remediation based upon GeoInsight's opinion that soil and groundwater impacts outside of AOIs #2 and #3 are most likely the result of impacted groundwater migration out of these source zones and that once the source zones are remediated, downgradient impacts will attenuate through physical and biological processes. The COC source areas and areas of TCE exceedances in soil that will be targeted for remediation correspond to those areas depicted on Figure 5.

Through a preliminary screening process and in consultation with remedial specialists from XDD Environmental LLC, GeoInsight selected three remedial technologies that could be used alone or in combination to achieve active remediation objectives. The technologies included: 1) excavation with on- or off-Site treatment and disposal; 2) in-situ chemical oxidation; and 3) in-situ thermal treatment. Each technology was evaluated based upon its ability to remediate the target areas at three different target depths:

1. ground surface to 7 feet bgs, primarily unsaturated soils;
2. 7 to 15 feet bgs, within the USU and accessible for excavation; and
3. 15 to 25 feet bgs, within the USU to the top several feet of the SCU.

Although impacts have been detected in the LSU, for the purposes of this evaluation, it assumed that these areas can be addressed though smaller-scale targeted remediation, if needed. Furthermore, because it is possible that impacts in the LSU are the result of soil drag-down during drilling or migration from the USU through compromised well seals, impacts are interpreted to be localized in the lower hydrogeologic unit and will likely be reduced when upper hydrogeologic unit impacts are remediated.

The three technologies were rated on their advantages/disadvantages, timeframe for active remediation, cost, and degree of certainty (as reflected by cost range). Rating results are summarized in Table 8. Based upon this evaluation, GeoInsight recommended in-situ thermal treatment as the technology most capable of meeting active remediation objectives, with the greatest degree of certainty, and at a comparatively lower cost. The three primary methods for heating the subsurface, steam-enhanced extraction (SEE), electrical resistance heating (ERH), and thermal conductance heating (TCH), were considered during the evaluation, with input from two companies that offer all three heating approaches. SEE was rated higher than ERH and TCH and was selected as the intended method, primarily due to an anticipated lower cost. The SEE cost was derived under the assumption that steam is a more effective heat delivery mechanism in moderately transmissive aquifers, such as the upper hydrogeologic unit, in comparison to ERH or TCH. However, because only a screening evaluation was performed, GeoInsight's recommendation is to solicit bids from at least three thermal companies that each have SEE, ERH, and TCH capabilities to further evaluate the most suitable technology(ies) given Site conditions.

5.2 PROPOSED APPROACH

GeoInsight understands that the Town would like to have active remediation at the Site underway in 2021. Based upon this understanding, we anticipate the following approach and schedule for implementation.

- Upon NHDES' conceptual approval of the proposed remedial approach, GeoInsight will prepare performance-based contractor bid specifications for thermal treatment of the DNAPL source area and the larger area containing TCE impacts exceeding SRS. The bid specifications will require the bidding contractors to prepare conceptual treatment design plans to be included with their bid documents. GeoInsight will solicit bids from at least three thermal companies, as indicated above. At this time, it is anticipated that bids will be received by the end of January 2021.

- Following the bid procurement process, GeoInsight will submit a remedial design report for NHDES review that will include the conceptual thermal design plans (provided by the thermal remediation vendors as a part of their bid packages); an approach for overseeing the thermal remediation field activities; a remedial performance testing approach (soil borings and groundwater sampling); cleanup goals for soil and groundwater; and a

monitoring program for temperature, DNAPL movement, and vapor intrusion around the thermal treatment zone. Target zones within the different stratigraphic units will be specified. In addition, a list of permits that may be required as part of remediation will be included, as well as an indication as to whether any AURs may be necessary following remediation. Currently, GeoInsight anticipates that this remedial design document will be submitted around the end of January 2021.

- Assuming the Town budget to include costs for thermal remediation based upon the bids received is approved at the March 2021 Town meeting, it is anticipated that the Town would execute a contract with the selected thermal contractor for implementation initiating in 2021. Upon execution of the contract, the selected contractor would prepare final design plans for the selected remedial alternative(s). The final design plans would be certified by the selected contractor's New Hampshire-licensed Professional Engineer and reviewed by GeoInsight, and along with construction specifications, would be submitted to NHDES.

Notes:

1. Monitoring wells GZ-10U and GZ-10L were destroyed and were replaced by wells GZ-10UR and GZ-10LR in June 2019.
2. Monitoring well construction details for well GZ-412 were not available in the information reviewed by GeoInsight.

Notes:
1. Measurements are in feet.
2. TOC = top of casing; NS = not surveyed during 2019 PDI survey
3. Elevation survey data were collected by WSP USA, Inc. on September 17, 2019 using a Nikon-AP-8 Automatic Level and are reported relavite to NAVD 88.
4. A Slope Indicator water level meter was used to collect the water level data for this round; however, the water levelmeter stopped responding to water prior to the bottom of the well indicating possible DNAPL.
5. * Indicates top of steel casing elevation
6. † Indicates ground surface elevation

Notes:
1. Measurements are in feet.
2. TOC = top of casing; NS = not surveyed during 2019 PDI survey
3. Elevation survey data were collected by WSP USA, Inc. on September 17, 2019 using a Nikon-AP-8 Automatic Level and are reported relavite to NAVD 88.
4. * Indicates top of steel casing elevation

Notes:
1. Only detected compounds are shown.
2. Results are reported in micrograms per liter (µg/L).
3 ND indicates the constiuent was not detected above the laboratory reporting limit, shown.
4. **BOLD** concentrations exceed the applicable New Hampshire Department of Environmental Services (NHDES) Ambient Groundwater Quality Standard (AGQS).
5. NS = no standard; -- indicates a parameter was not analyzed or data are not available.
6. "E" indicates a constituent was detected above the calibration range and reported as as estimated value.
7. 1,4-Dioxane reported using USEPA Method 8270 with selected-ion monitoring (SIM), if analyzed.
8. DUP indicates a duplicate sample.

Notes:
1. Only detected compounds are shown.
2. Results are reported in micrograms per liter (µg/L).
3 ND indicates the constiuent was not detected above the laboratory reporting limit, shown.
4. **BOLD** concentrations exceed the applicable New Hampshire Department of Environmental Services (NHDES) Ambient Groundwater Quality Standard (AGQS).
5. NS = no standard; -- indicates a parameter was not analyzed or data are not available.
6. "E" indicates a constituent was detected above the calibration range and reported as as estimated value.
7. 1,4-Dioxane reported using USEPA Method 8270 with selected-ion monitoring (SIM), if analyzed.

Notes:
1. mg/kg = milligrams per kilogram.
2. ND(x) indicates analyte was not detected above the quantitation limit noted in parentheses.
3. -- = not analyzed or results not available.
4. NS = no standard available.
5. New Hampshire Department of Environmental Services (NHDES) Ambient Groundwater Quality Standards (AGQS) and Water Quality Criteria for Toxic Substances (WQCTS) are shown for comparison purposes.

NOTES:

1. Only detected concentrations (those below the laboratory reporting limit were excluded) and concentrations above approximately 1 mg/kg for TCE, and calculated values of 1 percent of the TCE solubility limit (or higher) for TCE were presented in the TCE pore water calculations in this table.
2. DUP = indicates the result from the duplicate portion of a split soil sample was used; TCE = trichloroethene; mg/L = milligrams per liter.
3. Equation used for calculation of pore water TCE concentration from United States Environmental Protection Agency Publication 9355.5-07FS, January, 1992, "Estimating Potential for Occurrence of DNAPL at Superfund Sites." $C_w = (C_t * B_d) / (K_d * B_d + n_w)$.

where:

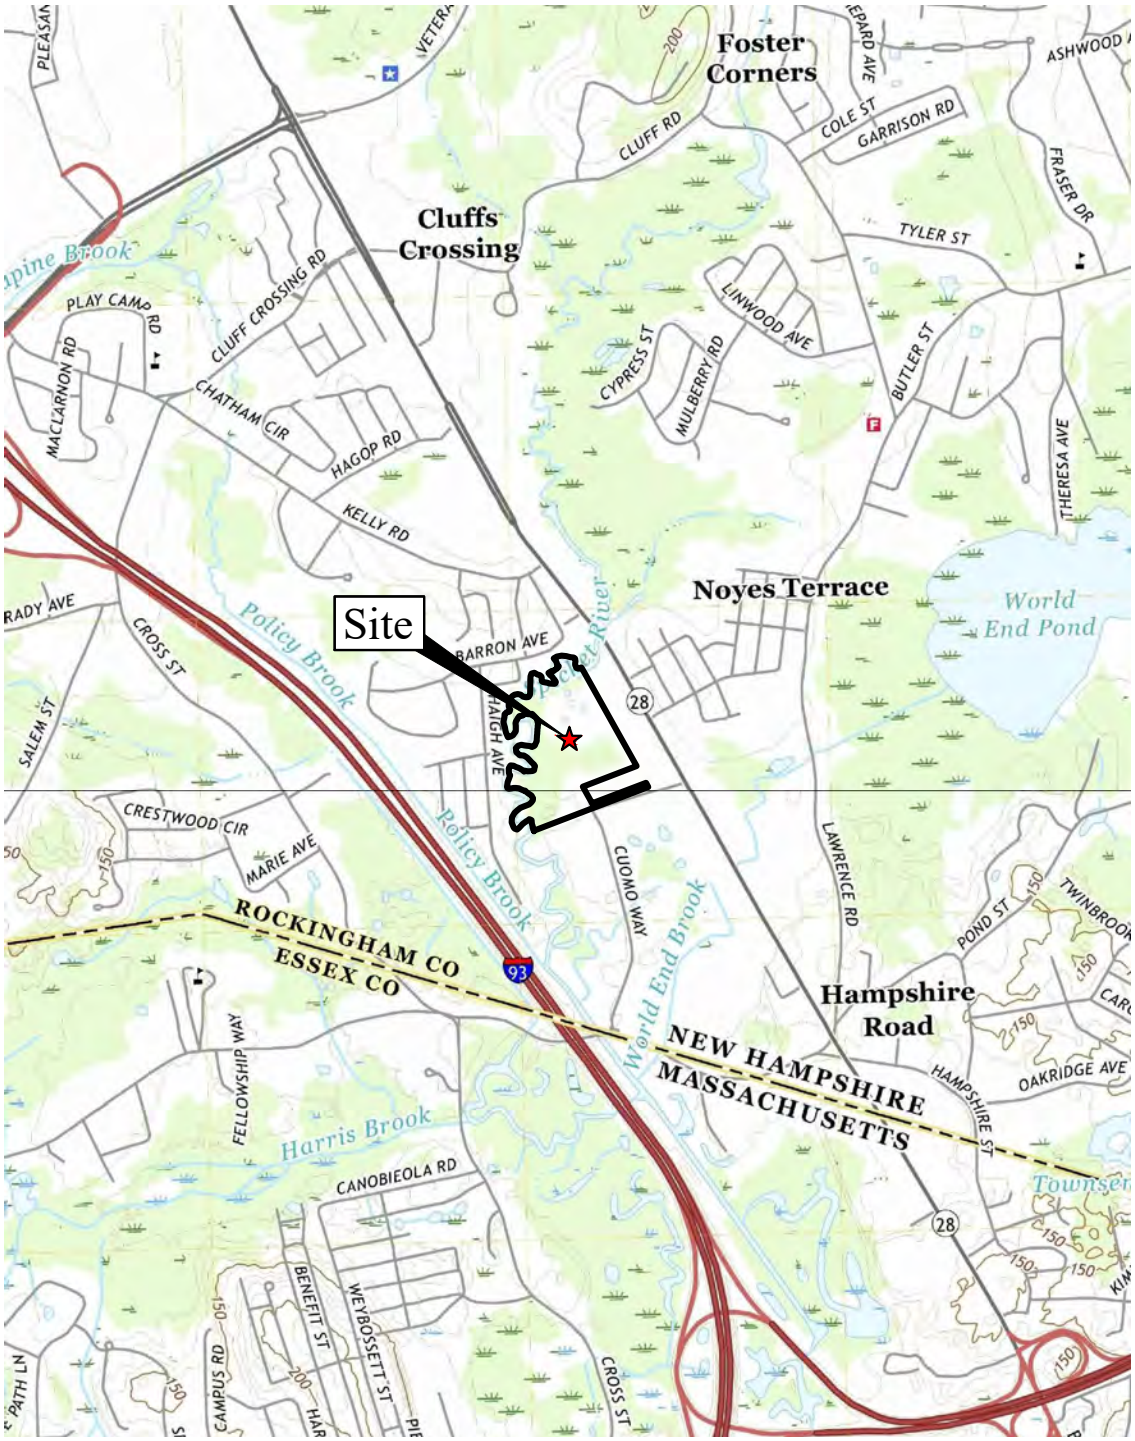
C_w = calculated pore water concentration (mg/L);
C_t = concentration (mg/kg) of VOCs in soil (in this case, taken from TCE concentrations measured in soil samples completed during the PDI and previous Site investigations and summarized in Table 1);
B_d = bulk density for all units = 1.5 grams per cubic meter (in this case, taken from a mean of literature values in Bowles 1982);
n_w = water-filled porosity = 0.35 (obtained from literature values, including Fetter 1994); and
K_d = sorption partitioning coefficient calculated using the following equation (Fetter 1999). Value used for Sand: 2.64e-3; value for Silty Sand: 9.55e-3; and value for Silty Clay: 9.93e-3.

$$K_d = K_{oc} * F_{oc}$$

where:

K_{oc} = organic carbon partitioning coefficient for TCE = 129 L/kg (from the same three sources cited for the TCE solubility limit); and
F_{oc} = fraction of organic carbon from TOC analytical data (see below).

>100% of the TCE Solubility
50 to 100% of TCE Solubility
10 to 50% of TCE Solubility



TOTAL ORGANIC CARBON DATA USED TO CALCULATE f_{oc} and K_d

TABLE 8
REMEDIAL ALTERNATIVES SCREENING SUMMARY
FORMER SALEM WASTEWATER TREATMENT FACILITY
SALEM, NEW HAMPSHIRE
NHDES #198405033

TECHNOLOGY	Impacted Soil Excavation & Off-Site Disposal	In-Situ Chemical Oxidation ("ISCO" or "Chem Ox")	Thermal	
			Steam-Enhanced Extraction (SEE)	Electrical Resistivity Heating (ERH) | Thermal Conduction Heating
PROs	Physically removes DNAPL source soil and soil with NH soil standards exceedances and replaces with imported backfill (0 to 25 ft). ONE STOP remedial approach.	Effective at treating site VOCs in the dissolved-phase (see CON related to DNAPL below). Proven technology at similar sites in NH.	Considered one of the more reliable in-situ remedial technologies with a high degree of certainty for achieving remedial goals. Very effective at treating DNAPL (volatilizing and liquid recovery) and VOCs in dissolved phase. More cost-effective than ERH-Thermal at sites with large contaminant areas (>10,000 cubic yards) - the Site has >15,000 CY. Performed in-situ - no excavation or disturbance to the native soil (other than steam well and recovery well installations). Permeable site soil makes it highly compatible with the SEE approach. Active SEE remediation may be limited to less than 1 year. ONE STOP remedial approach.	Similar PROs as SEE-thermal approach, but more "aggressive" technology.
CONs	Implementation of excavation requires substantial shoring and dewatering adding cost and complexity.	ISCO (via injection) can't target impacted soil above the water table, so other (costly) methods are needed for remediation of 0-7 feet (excavation & disposal or soil mixing).	Relatively expensive capital costs compared to other remedial technologies (this CON is negated by the large area of treatment at site, which prices ISCO and excavation out as comparable options).	More expensive than SEE for the Site due to the large area targeted for remediation and the depth greater then 20 feet required for treatment.
	Significant uncertainty in disposal costs due to TCE (hazardous waste listing) and PFAS presence on-site.	DNAPL source zone requires pre-treatment with surfactant prior to ISCO (added cost).	Requires significant above ground infrastructure for approximately 1 year (negated as the Site is vacant and mostly open space).	Cost estimating is difficult without actual vendor bidding (due to existing vs. needed electrical infrastructure and power supply/timing, and costs for electrical anodes based upon depths and spacing from vendor site-specific designs).
PROs > CONs	No	No	Yes (& limited Cons)	No - unless actual costs bid for ERH or TCH, and guarantee, make it more competitive with SEE.
TIME FRAME	1 to 2 years	1 to 3 years	12 to 18 months	12 to 18 months
COST	**$7.6 to $13MM**	**$4.7 to $5.5MM**	**$4.225MM**	**$6.11MM** ($6.89MM With Guarantee)
WHY COST RANGE?	LOW = non-hazardous landfill disposal with no PFAS restrictions. HIGH = hazardous waste landfill disposal.	LOW = non-hazardous landfill disposal for 0-7 ft zone with no PFAS restrictions. HIGH = hazardous waste landfill disposal for 0-7 ft zone.	N/A	Premium for remedial contractor guarantee

APPROX. SCALE IN FEET

NOTES

1. FOR THOSE SAMPLES WHERE TCE WAS NOT DETECTED ABOVE LABORATORY REPORTING LIMITS, 1/2 OF THE POSTED REPORTING LIMIT VALUE WAS CONSIDERED WHEN DEVELOPING CONTOURS. THE SAMPLE RESULT FROM WELL GZ-3B WAS NOT CONSIDERED IN DEVELOPMENT OF THE CONTOURS, AS THE WELL IS COMPLETED IN BEDROCK. THE SAMPLE RESULT FROM WELL GZ-902L WAS NOT CONSIDERED, AS THE WELL IS SCREENED DEEPER THAN OTHER LOWER UNIT WELLS IN THIS AREA.

2. ISOCONTOURS ARE BASED ON DATA FROM WIDELY SPACED MONITORING LOCATIONS, AND OTHER INTERPRETATIONS ARE POSSIBLE.

NOTES

1. SOIL SAMPLES WERE NOT COLLECTED AT MIP LOCATIONS; THEREFORE, THE STRATIGRAPHIC UNITS FOR SAMPLES COLLECTED FROM THESE LOCATIONS (I.E. UPPER UNIT VS SILTY CLAY) WERE INFERRED BASED ON OBSERVATIONS IN NEARBY BORINGS, BUT COULD NOT BE CONFIRMED.
2. THE APPROXIMATE EXTENTS OF EXCEEDANCES OF NHDES SOIL REMEDIATION STANDARDS (SRS) ARE BASED ON ANALYTICAL RESULTS OF SAMPLES COLLECTED FROM THE PDI, AS WELL AS PREVIOUS INVESTIGATIONS, AS TABULATED IN APPENDIX C. IN ADDITION, FIELD INDICATORS OF CONTAMINATION (ELEVATED PID READINGS AND OLFACTORY OBSERVATIONS) INDICATED ON SOIL BORING LOGS FROM PREVIOUS INVESTIGATIONS WERE CONSIDERED FOR LOCATIONS EXCEPT MIP LOCATIONS.
3. REFER TO THE TEXT FOR AN EXPLANATION OF THE CALCULATIONS OF CALCULATED TCE PORE WATER CONCENTRATIONS.
4. THE EXTENT OF PORE WATER CONCENTRATIONS AT 10% OF THE ESTIMATED SOLUBILITY OF TCE AND THE EXTENT OF EXCEEDANCES OF SRS ARE BASED ON A LIMITED NUMBER OF SAMPLES FROM WIDELY SPACED EXPLORATION LOCATIONS. OTHER INTERPRETATIONS ARE LIKELY, AND ACTUAL CONDITIONS LIKELY VARY FROM THOSE DEPICTED.
5. EXTENTS OF CONTAMINATION ARE PRESENTED FOR TCE ONLY. IN SOME SAMPLES WITH NO TCE EXCEEDANCES, EXCEEDANCES FOR OTHER VOCS WERE DETECTED.

LIMITATIONS

The observations and conclusions described in this Report are based solely on the Services provided pursuant to the Agreement with the Client and any approved additional services authorized by the Client. Without limitation of any other applicable limitations or conditions, neither GeoInsight nor the Licensed Staff shall be liable for the existence of any condition, the discovery of which would have required the performance of services not authorized under the Agreement.

The passage of time may result in changes in technology, economic conditions or regulatory standards, manifestations of latent conditions, or the occurrence of future events, which would render this Report inaccurate or otherwise inapplicable. Neither GeoInsight nor the Licensed Staff shall be liable or responsible for the consequences of any such changed circumstances or conditions on the accuracy of this Report.

Should GeoInsight or the Licensed Staff be required or requested to review this Report after its date of submission, GeoInsight shall be entitled to additional compensation at then existing rates or such terms as may be agreed upon between GeoInsight and the Client. Nothing herein contained shall be deemed to require GeoInsight or the Licensed Staff to undertake any such review or authorize others to use this Report.

The conclusions stated in this Report are based upon: (1) Visual observations of existing physical conditions; (2) Review and interpretation of Site history and Site usage information, which was made available or obtained within the scope of work authorized by the Client; (3) Information provided by the Client; (4) Information and/or analyses for designated substances or parameters provided by an independent testing service or laboratory on a limited number of samples; and (5) A set number of subsurface explorations made on dates indicated in documentation supporting the Report. GeoInsight was not authorized and did not attempt to independently verify the accuracy or completeness of information or materials received from the Client and/or from

laboratories and other third parties during the performance of its services. Neither GeoInsight nor the Licensed Staff shall be liable for any condition, information, or conclusion, the discovery of which required information not available to the Licensed Staff or for independent investigation of information provided to the Licensed Staff by the Client and /or independent third parties.

This Report is rendered for the limited purpose stated above, and should not be deemed to be an opinion concerning the compliance of any past or present owner or operator of the Site with any federal, State, or local law or regulation. NO WARRANTY OR GUARANTEE, WHETHER EXPRESSED OR IMPLIED, IS MADE BY THIS REPORT, AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE ARE EXPRESSLY DISCLAIMED. Without limiting the generality of the foregoing, no warranty or guarantee is made that all contamination at a Site or sources or contamination has been detected or identified, that any action or recommended action will achieve all of its objectives, or that this Report or any action as to which this Report relates will be upheld by any review conducted by NHDES or any other party.

DATE: April 8, 2019

RE: Pre-Design Investigation Work Plan
Former Wastewater Treatment Facility
Salem, New Hampshire

This Pre-Design Investigation Work Plan (Work Plan) was prepared by Woodard & Curran, Inc. at the request of the Town of Salem, NH for the former Salem Wastewater Treatment Facility located on SARL Drive in Salem, New Hampshire (the Site). Woodard & Curran, Inc. was retained by the Town of Salem in November 2018 to continue with response actions for the former wastewater treatment facility.

Historical operations at the Site resulted in releases and/or discharges of volatile organic compounds (VOCs), polychlorinated biphenyls (PCBs), and select metals which have been identified in soil, groundwater, soil vapor, pore water, and/or surface water. The primary constituents of concern that have the largest distribution at the Site are VOCs including trichloroethylene (TCE), tetrachloroethylene (PCE), 1,1,1-trichloroethane (1,1,1-TCA), and associated breakdown constituents. Other VOCs including petroleum/gasoline constituents and carbon tetrachloride were also detected in specific areas of the Site.

Remedial activities have been implemented historically at the site which consisted primarily of bioremediation technologies that were implemented in a downgradient location from source areas and field scale pilot studies using Zero Valent Iron (ZVI) and other bioremediation technologies. These remedial activities ceased in 2007 and 2014, respectively. This Work Plan outlines proposed investigation activities to collect data necessary to further characterize potential source areas and develop a final remedial design to be presented in the forthcoming revised Remedial Action Plan (RAP).

A Site Locus is provided as Figure 1. A Site Plan is provided as Figure 2. A site layout showing former waste water treatment facility features is provided as Figure 3. Historical referenced illustrating former locations of wastewater treatment facility features and other potential sources (former open channel, sludge pits, etc.) are included in Appendix A.

1. INVESTIGATION OBJECTIVES

The primary objectives of the proposed Pre-Design Investigation (PDI) include:

1. Evaluation of soil and groundwater quality in the vicinity of potential source areas to define the extent of contamination; and

2. Collection of data necessary to evaluate remedial alternatives.

Soil samples will be collected in and around potential source areas and will be analyzed primarily for volatile organic compounds (VOCs) to characterize the extent of impacts to soil and groundwater. Select soil samples will also be analyzed for total organic carbon (TOC), grain size, and oxidant demand to support remedial design decisions. Additional monitoring wells will also be installed, and a subsequent site-wide groundwater sampling event will be conducted to further evaluate the presence of VOCs in groundwater in the vicinity of potential source areas. Preliminary locations for monitoring well locations are discussed in the following sections. Additional analyses will also be conducted for select soil and

groundwater samples to evaluate remedial design alternatives, including analyses for additional metals, oxidant demand, grain size/sieve analysis, and other general chemistry parameters.

In addition, in anticipation of on-site use of stockpiled soils, soil samples will be collected from the existing stockpile for the following parameters including: VOCs, semi-volatile organic compounds (SVOCs), total petroleum hydrocarbons (TPH), metals, pesticides, herbicides, PCBs, corrosivity, and reactivity as described further below.

2. INVESTIGATION COMPONENTS

The following sections detail the proposed investigation activities designed to meet the investigation objectives discussed in Section 1. Prior to commencement of investigation activities, a site walk will be conducted to mark out and finalize investigation locations. Sample locations will be field located using a handheld Global Positioning System (GPS) unit and marked with stakes. The sampling locations as shown on Figures 4a and 4b are approximate and may be adjusted based on field observations indicating the presence of potential source areas (e.g. stressed vegetation, mounding, etc.). Locations may be added, removed, or adjusted based on the results of field VOC Headspace screening and visual observations during sampling activities to define the extent of impacts associated with potential source areas.

Dig Safe will also be contacted prior to commencement of investigation activities and pre-clearing activities using vacuum excavation techniques will be completed in developed areas to confirm the presence (or lack of) utilities and other obstructions within the subsurface. Holes will be pre-cleared to a minimum depth of 5 feet below ground surface (bgs). Soil will be placed back down the hole once it is removed and the pavement will be patched to reduce the potential for trip hazards. In the event that utilities are encountered, information including size of pipe, orientation (north, south, east, west), and depth to top of pipe will be documented in the project specific field book and the sample location will subsequently be relocated.

2.1 Stockpile Sampling

As discussed in Section 1, samples will be collected from the existing soil stockpile to characterize the soil in anticipation of reuse on site. The stockpile, which is estimated to include approximately 2,000 cubic yards (CY) of soil, will be divided into four sections. Samples will be collected from a minimum of 5 discrete locations within each section using excavator or backhoe at varying depths but no less than 12-inches below the surface the stockpile. All samples will be screened with a Photoionization Detector (PID). Within each section, the discrete sample with the highest PID screening level will be designated for laboratory analysis of VOCs by EPA method 8260C. Composite samples will be generated for each section from a minimum of five discrete sample locations, resulting in an approximate sample frequency of 1 per 500 CY. To evaluate potential reuse of the stockpiled soil, the four samples will be collected and analyzed for potential constituents of concern listed in NHDES ENV-OR 606.19 Soil Remediation Criteria, Table 600-2 Soil Remediation Standards or the following:

- SVOCs via EPA method 8720D;
- Priority Pollutant 13 Metals including Antimony, Arsenic, Beryllium, Cadmium, Chromium, Lead, Mercury, Nickel, Selenium, Silver, Thallium, via EPA method 6010C/7471B; and
- PCBs via EPA method 8082A.

2.2 Soil Borings and Sampling

A summary of the soil investigation plan is provided in Table 1 and shown on Figures 4a and 4b. Further details regarding the proposed sampling in each Area of Investigation (AOI) are provided below. The spacing of soil sample locations is dependent upon the type of area being sampled, the sampling

objective, and the extent of current data available. The rationale for sample location selection within each AOI is further discussed in the following sections and summarized in Table 1.

Soil samples will be collected in accordance with Woodard & Curran SOP S-1, Standard Operating Procedure for Soil Sampling and Woodard & Curran SOP S-2, Standard Operating Procedure for the Collection and Preservation of Soil Samples for Analysis of VOCs, provided in Appendix B. Borings in the AOIs will be advanced using a direct-push Geoprobe drill rig. Soil samples will be observed and characterized using a modified Burmeister soil classification system and will be field screened with an 11.7 eV PID for VOC levels via the jar headspace method in accordance with Woodard & Curran SOP S-3, Standard Operating Procedure for Headspace Field Screening (Appendix B).

Borings will be extended until the confining layer is encountered. If the confining layer is not encountered, borings will continue to be advanced until a significant reduction in PID results is observed based on professional judgement and PID measurements collected previously at the site. At select locations not located within critical source areas or areas with elevated concentrations of VOCs and only if PID screening results are less than 10 parts per million by volume (ppmv) in the upper hydrogeologic unit, borings may be extended into and through the confining layer into the lower hydrogeologic unit with the Geoprobe drill rig. The purpose of this approach is to expedite site characterization and help define the confining layer and lower hydrogeologic unit VOC concentrations in select locations across the site and in proximity to source areas. The borings that penetrate the confining layer will be backfilled with bentonite chips that will expand and fill the small diameter (2-inch diameter) borehole upon extraction of the macro-core sampler. This approach will limit the potential for vertical migration of contaminants from the upper to the lower hydrogeologic unit. If deeper borings are warranted to assess the lower hydrogeologic unit within source areas, telescoping drilling methods will be used during the monitoring well installation phase of this work. PID results will be documented in the field book and utilized to determine sample selection for laboratory analysis. Soil samples will be analyzed for the following:

- VOCs by EPA Method 8260C (all samples);
- Total Organic Carbon (TOC) by EPA method 9060 (select locations only);
- Grain size by ASTM D 422 (select locations only);
- Oxidant Demand Analysis (select locations only); and
- Total Petroleum Hydrocarbons (TPH) by EPA method 8100 (select locations in AOI #1 to evaluate the former petroleum underground storage tank; UST).

Within each upper hydrogeologic unit boring, the sample collected with the highest PID screening level will be designated for laboratory analysis of VOCs. In deeper borings which extend into the lower hydrogeologic unit, samples with the highest PID screening level will be collected from each hydrogeologic unit and designated for laboratory analysis of VOCs. In approximately every five borings within an AOI, an additional sample will be collected from the bottom of each boring that has a very low or non-detect headspace measurement and submitted for laboratory analysis of VOCs. In addition, up to 10 samples per AOI will be submitted for analysis of TOC and grain size (sieve analysis). Up to four samples will be submitted for oxidant demand analysis in order to obtain data necessary for remedial design, as discussed in further detail below, with two samples collected from within AOI #2 (DNAPL Area; one upper unit sample and one lower unit sample), one sample collected from AOI #1 (Former Waste Water Treatment System Area), and one sample collected from AOI #3 (Other Potential Sources Area).

In addition to the primary samples, quality control samples, including equipment blanks, trip blanks, and field duplicates, will be collected during the sampling program in accordance with the NHDES Hazardous Waste Remediation Bureau (HWRB) Master Quality Assurance Project Plan (QAPP) as follows:

FIELD QUALITY CONTROL SAMPLING PLAN

QC Sample	Frequency	Acceptance Criteria	Corrective Action
Equipment Blanks	One per piece of non-dedicated sample equipment per AOI	No site contaminants are detected	Flag in project report
Trip Blanks	One trip blank per COC per sample cooler	No site contaminants are detected	Flag in project report
Field Duplicates	One field duplicate per 20 samples	RPD +/- 50%	Flag in project report

The following subsections provide further details on the specific investigation objectives, sampling locations, depths, procedures and analysis for each AOI, provided on Figure 2.

2.2.1 AOI #1 Former Waste Water Treatment Facility Area

The specific soil sampling objective for AOI #1 is to characterize and define the extent of contamination associated with the following potential source areas:

- The two former trickling filters;
- The former 200-gallon petroleum UST;
- The former sludge drying beds;
- The former treatment plant outfall; and
- The existing sewer utility.

A total of 24 borings are anticipated to be advanced in AOI #1. Locations were chosen to supplement existing data and evaluate the impact of the potential source areas listed above that have not previously been evaluated.

Borings will be installed at approximately five locations in the vicinity of the trickling filters, with one location to include both a shallow and deep boring to be converted into a monitoring well couplet as discussed in Section 2.3. Five borings will be installed in the vicinity of the former petroleum UST and five borings will be installed in the vicinity of the former sludge drying beds. Three borings will also be installed in the northwest portion of AOI #1 to evaluate the area downgradient of these potential sources in the direction of the wetland. Additional borings will also be installed in the vicinity of the former treatment plant outfall (four of which are located within AOI #1 and 10 of which are located in AOI #5) to a depth of five feet using a hand auger and/or manual Geoprobe. One additional boring will also be installed and converted to a microwell in the fill surrounding the sewer line in AOI #1 to evaluate the potential for preferential migration through the utility fill, as further discussed in Section 2.2.7. Refer to Figure 4a and Table 1 for the boring locations.

2.2.2 AOI #2 DNAPL Area

The specific soil sampling objective for AOI #2 is to characterize and define the extent of contamination associated with the following sources areas:

- The former northernmost sludge pit;
- The former north soil pile (including the area in the vicinity of GZ-TW-1L, where the presence of dense non-aqueous phase liquid [DNAPL] was previously identified);
- The former open drainage channel; and
- The existing sewer utility.

A total of 39 borings are anticipated to be installed in AOI #2. Several historical investigations have been conducted within AOI #2 in the past, including soil samples collected in June and July 2016 as part of the MIP investigation. Investigation locations were chosen based on a review of available historical soil data, to supplement the existing data, and focus data collection efforts on previously uncharacterized areas of AOI#2, namely, the southern portion of AOI #2 near the historic open channel, the eastern portion of AOI #2, the former northernmost sludge pit, and the sewer line.

Borings will be installed at approximately seven locations in the vicinity of the former northernmost sludge pit, seven locations in the vicinity of the former north soil pile, 10 locations near the former open channel, seven locations in the eastern portion of AOI #2, and three borings will also be installed west of the utility corridor to define the extent of elevated VOC concentrations in soil and groundwater. Borings will be advanced until the confining layer is encountered using a direct-push Geoprobe drill rig. It is anticipated that borings at seven of these locations will be extended beyond the confining layer to the lower hydrogeologic unit using telescoping drilling techniques to minimize the potential for vertical migration of contaminants in the upper hydrogeologic unit to the lower hydrogeologic unit. Of these seven locations, one boring will be converted to a monitoring well in the upper hydrogeologic unit. At this time, we do not anticipate a well in the lower unit. However, data collected during this PDI may warrant a well installed in the lower unit. This decision will be made based on field data collected in this AOI. Estimated depth to the confining layer at these locations is presented in Table 1.

In addition, five borings will be installed in the fill surrounding the sewer line in AOI #2 to evaluate the potential for preferential migration through the permeable utility backfill. Three of these locations will be converted to microwells. Refer to Figure 4b and Table 1 for the boring locations.

2.2.3 AOI #3 Other Potential Source Areas

The specific soil sampling objective for AOI #3 is to characterize and define the extent of contamination associated with the following areas:

- The former southernmost sludge pit;
- The former open channel;
- The former southern soil stockpile and associated impacted soil; and
- The existing sewer utility.

A total of 44 borings are anticipated to be advanced in AOI #3. Historical soil analytical data are not available at any location within AOI #3. Based on a review of limited historical field screening data, investigation locations were chosen to evaluate the impact of the potential source areas listed above that have not previously been evaluated. Borings will be installed at approximately 29 locations in the vicinity of the former southernmost sludge pit and former open channel and 13 locations in the vicinity of the former southern soil stockpile. In addition, two borings will be advanced in the fill surrounding the sewer line to evaluate the potential for preferential migration through the permeable utility backfill. One of these locations will be converted to a microwell. Refer to Figure 4a and Table 1 for the boring locations.

2.2.4 AOI #4 Undeveloped Upland Area

The specific soil sampling objective for AOI #4 is to collect data representative of this area to evaluate upgradient conditions. Soil samples have not been historically collected from this area, and only limited field screening data and groundwater data are available. Therefore, a total of three borings are anticipated to be advanced and converted to upper unit monitoring wells to characterize upgradient conditions. Borings will be advanced until the confining layer is encountered using a direct-push Geoprobe drill rig. Estimated depth to the confining layer at these locations is presented in Table 1. Select borings may be advanced through the confining layer depending on field screening results, as described above. Refer to Figure 4a and Table 1 for the boring locations.

2.2.5 AOI #5 Wetland and River Area

The specific soil sampling objectives for AOI #5 are to characterize and define the extent of contamination associated with the former treatment plant outfall and to evaluate impacts to the northwestern portion of the wetland and river area from upgradient sources. A total of 16 borings are anticipated to be advanced in AOI #5. Locations were chosen based on a review of limited historical data, with a primary focus of investigating areas of the wetland not previously characterized but likely to be impacted by upgradient sources.

Borings will be advanced at approximately 10 locations to a depth of 5 feet bgs using a hand auger and/or manual Geoprobe methods near the former treatment plant outfall. Two borings will be converted to piezometers to evaluate shallow groundwater quality in the vicinity of the former outfall. An additional five borings will be advanced across the northwestern portion of the wetland area. One of the five locations will be converted to a piezometer, a second location will be converted to an upper hydrogeologic unit monitoring well, and a third location will include a shallow and deep boring to be converted to a monitoring well couplet as discussed in Section 2.3. Refer to Figure 4a and Table 1 for the boring locations.

2.2.6 AOI #7 Downgradient Area

As part of the scope of work presented herein, monitoring wells GZ-10U and GZ-10L were destroyed and will be replaced as described in Section 2.3. These wells are located west of the Spicket River in AOI #7. During monitoring well installation activities, soil samples may be collected from these borings if PID measurements are elevated above 10 ppmv in the soil and will be submitted for laboratory analysis of VOCs.

2.2.7 Existing Sewer Utility Evaluation

As discussed in Sections 2.1.1, 2.1.2, and 2.1.3 above, samples will be collected from soil surrounding the sewer line in AOI #1, AOI #2, and AOI #3 to evaluate the potential for preferential migration through the utility fill.

In summary, an estimated five borings will be advanced along the utility corridor three of which will be converted to microwells as shown on Figures 4a and 4b and discussed further in Section 2.3. Borings will be advanced until the confining layer is encountered using a direct-push Geoprobe drill rig. Estimated depth to the confining layer at these locations is presented in Table 1. Within each boring, the sample interval with the highest PID screening level will be designated for laboratory analysis of VOCs. In approximately every three to five borings, additional confirmatory samples will be collected from the bottom of each boring and submitted for laboratory analysis of VOCs. Airspace readings will also be recorded from within each of the manholes using a PID.

2.3 Monitoring Well Installation

It is anticipated that two new monitoring well couplets (screened in the upper and lower hydrogeologic units), four upper hydrogeologic unit monitoring wells, and one lower hydrogeologic unit monitoring well will be installed to further characterize and define the extent of groundwater impacts, evaluate groundwater transport pathways, and refine remedial alternatives for the site. Preliminary locations are depicted on Figures 5a and 5b and listed in Table 2. Final locations will be chosen based on the results of the soil investigation and will be communicated to NHDES prior to installation. Monitoring wells GZ-10U and GZ-10L, which were previously destroyed, will be replaced in approximately the same location as the destroyed wells. Routine monitoring of these wells is required as part of the Groundwater Management Permit (GMP) for the site, as discussed in the 2017-2018 Periodic Summary Report submitted in February 2019.

Monitoring wells will generally be installed where soil borings were advanced using a Geoprobe rig and therefore, soil samples will not be collected with the exception of potentially upgradient wells located in AOI#4. For monitoring wells located in AOI #4, soil samples will be collected every five feet during drilling activities for soil classification using a modified Burmeister system and field screening using a PID. Permanent monitoring wells will be installed using a hollow-stem auger or drive and wash drill rig. Wells will be constructed using 2-inch diameter schedule 40 PVC with 10-foot long, 0.010-slotted well screen installed as follows:

- Upper unit wells will be screened across the water table with approximately two to three feet of wells screen above the water table to account for seasonal fluctuations; and
- Lower unit wells will be screened below the confining layer within the interval with the highest PID measurement.

These wells will be finished at the ground surface with J-plugs and protective standpipes for easier identification during sampling events. Following installation, each monitoring well will be manually developed using surge and purge techniques to establish a hydraulic connection between the filter material and the aquifer. Well installation and development will be conducted in accordance with Woodard & Curran SOP S-6, Standard Operating Procedure for Drilling, Monitoring Well Installation and Monitoring Well Development included in Appendix B. Following development, the elevation of each well will be surveyed for incorporation into site plans and determination of potentiometric surface based on a uniform reference point.

It is anticipated that three 1-inch diameter piezometers may be installed within wetland areas associated with the Spicket River in AOI #5 to further evaluate groundwater impacts on the site and prior to the GMZ boundary, as shown on Figure 5a. Piezometers may be installed using a variety of hand methods including hand auger and/or manual Geoprobe setup. Piezometers will be constructed of a stainless steel drive point equipped with a 2-foot screen that will be advanced between approximately 3 and 7 feet bgs and sealed at the surface to the mitigate groundwater/surface water interactions. Threaded steel riser will be used to extend the piezometer to the surface. Piezometers will be surveyed to evaluate groundwater flow conditions.

It is anticipated that five microwells will be installed along the sewer utility corridor to evaluate the potential for preferential migration pathways through the utility backfill, as shown on Figures 5a and 5b. Microwells will be installed using direct push Geoprobe methods and will be constructed of 1-inch diameter schedule 40 PVC with 5-foot long, 0.010-slotted well screen installed across the vertical profile of the sewer utility.

The monitoring well, piezometers, and microwells will be surveyed to evaluate groundwater flow conditions.

2.4 Supplemental Groundwater Gauging and Sampling

Comprehensive groundwater gauging activities will be conducted prior to groundwater sampling activities in June and November and again in the summer of 2019 to evaluate seasonal groundwater flow directions across the site. Groundwater levels and DNAPL thicknesses will be measured at each accessible monitoring well, microwell, and piezometer using an interface probe in accordance with Woodard & Curran SOP S-8, Standard Operating Procedure for Water Level Measurements included in Appendix B. Comprehensive groundwater gauging events will be conducted in the spring, summer, and fall 2019.

Following installation, groundwater samples will be collected from the newly installed monitoring wells, piezometers, and microwells discussed in Section 2.3. In addition, samples will be collected from approximately 37 existing monitoring wells that have not been sampled as part of the annual GMP program. Locations for collecting site-wide groundwater samples are depicted on Figures 5a and 5b and listed in Table 2. These locations were chosen to supplement the annual GMP sampling events and obtain a “snap shot” of groundwater quality across the site.

Samples will be collected using low-flow groundwater sampling techniques in general accordance with Woodard & Curran SOP S-7, Standard Operating Procedure for Low Stress/Low Flow Groundwater Sampling, provided in Appendix B, and *EPA Region 1 Low Stress (low flow) Purging and Sampling Procedure for the Collection of Groundwater Samples from Monitoring Wells*, Revision 3 (January 19, 2010). Monitoring wells will be purged using peristaltic pumps with high density polyethylene tubing. Field measurements (temperature, specific conductivity [SC], dissolved oxygen [DO], pH, turbidity, and oxidation-reduction potential [ORP]) will be measured using a calibrated hand-held water quality meter during purging. At new well locations, samples will be collected a minimum of seven days following well development. Reusable sampling equipment will be decontaminated between locations.

Groundwater samples will be analyzed for VOCs by EPA method 8260C. Samples from up to 25 monitoring wells will also be collected and analyzed for 1,4-dioxane by 8260 SIM. Samples for 1,4-dioxane will be held at the lab pending results of the VOC analyses (i.e. if concentrations of VOCs required significant sample dilution, 1,4-dioxane will be analyzed via method 8260 SIM to achieve a lower reporting limit.)

To evaluate the potential for *in situ* treatment technologies (chemical and biological), samples from up to 10 locations may also be submitted for analysis of the following:

- Total chromium, total arsenic, total and dissolved iron, total and dissolved manganese by EPA 200.7/200.8/6010C/6020A;
- Hexavalent chromium by EPA 7196A;
- ORP by ASTM D 1498;
- Calcium by SW-846 6010D;
- Silica by SM 4500-SiO2;
- Phosphate by SM 4500P-E;
- Alkalinity by SM 2320B;
- Nitrate by EPA method 353.2/SM 4500NO_3-F;
- Methane, ethane, and ethene by RSK 175;
- TOC by SM 5310C/EPA 9060;
- Chloride by SM 4500CI-E/EPA 9251;
- Phosphorus by EPA 365.2/SM 4500P-E;
- Sulfide by SM 4500S_2-AD/EPA 9030B;
- Ammonia by EPA 350.1/SM 4500NH_3-BH/350.2/SM-4500NH_3-BE; and
- Sulfate by SM 4500SO_4-E/SM 426C/EPA 9038.

2.5 Health and Safety

All work detailed in this Work Plan will be performed in accordance with the site-specific Health and Safety Plan which provides details on potential hazards, personal protection equipment (PPE) and environmental monitoring required during soil and groundwater investigation activities.

2.6 Investigation Derived Waste Management

It is anticipated that investigation derived waste (IDW) generated during Pre-Design Investigation activities may consist of soil cuttings that accumulate during drilling activities and groundwater generated during monitoring well development and sampling. IDW will be managed in general accordance with State and Federal requirements.

Whenever possible, drill cuttings generated during soil boring advancement shall be placed back down the hole from which they were generated. For borings that partially or fully penetrate the confining layer, the hole will be filled with bentonite up through the confining layer then subsequently filled with soil cuttings. In the event that excess soil remains, it shall be containerized in 55-gallon drums.

Groundwater purged from monitoring wells during sampling and/or development activities will be returned to the point of generation. Any solids accumulated during well development will be allowed to settle out and containerized in 55-gallon drums.

Generated drums will be labeled and stored in a secure area pending disposal. NHDES will be notified of waste characterization results and proposed receiving facilities for approval prior to transportation of IDW for off-site disposal.

2.7 Decontamination

Non-disposable tools and equipment used for sampling will be decontaminated between sample locations and at the completion of the activities, as necessary. Following gross decontamination, equipment will be decontaminated through an Alconox™ scrub, followed by a water rinse.

3. DATA MANAGEMENT AND ANALYSIS

The analytical and field results generated as part of the Pre-Design Investigation will be used to further define the lateral and vertical extent of site impacts and for evaluation of potential remedial alternatives for incorporation into the revised RAP. Prior to incorporation into the RAP, data will be evaluated for usability and representativeness. Results of field and lab quality control samples will also be evaluated, and qualifications will be applied to the data, as necessary.

4. SCHEDULE

It is anticipated that Pre-Design Investigation activities will commence within 2 weeks of approval of this Work Plan by NHDES. Work will begin with the proposed soil boring program followed by monitoring well installation and groundwater sampling. It is anticipated that investigation activities will be completed within 4 weeks. If possible, groundwater sampling will be conducted concurrent with the June GMP sampling event.

APPENDIX B : STANDARD OPERATING PROCEDURES

SOP S-1

STANDARD OPERATING PROCEDURE FOR SOIL SAMPLING

Woodard & Curran, Inc.

Soil samples will be collected using a sample collection device that is appropriate for the environment and type of sample required. Samples may be collected using mechanical methods (split spoons, direct push) or hand collection techniques (hand augers, trowels, spoons, etc.) as required by physical characteristics and location of soil.

Equipment:

- Sample containers and labels.
- Sample collection device (soil auger, GeoProbe, or hand-held coring device).
- Personal protective clothing and equipment as required by a site-specific HSP.
- Photo ionization detector (PID), as appropriate (for VOCs only).
- Stainless steel or aluminum bowl and scoops.
- PVC or metal sleeve, if collecting samples from two depth intervals from a location where the water table is shallow table or wet conditions are expected.
- Hammer
- Decontamination equipment and supplies.
- Field logbook or sample collection sheets.
- Insulated cooler and ice.

Surficial Soil Sampling Procedure

1. Identify sample locations.
2. Clear ground surface of stones, vegetation, debris, etc.
3. Use a clean stainless steel trowel or hand auger to collect soil from the soil surface to the bottom of the depth interval. A trowel should be used for collecting shallow samples (as deep as approximately 4 inches), while a hand auger should be used for deeper samples or when the soil is compacted. Sufficient soil should be collected to fill the required sample containers.
4. If soil is to be analyzed for Volatile Organic Compounds (VOCs) or Gasoline Range Organics (GRO) collect and preserve samples in accordance with USEPA Method 5035A and Woodard & Curran S-2 immediately upon exposing the soil. VOC and/or GRO samples should be collected from the least disturbed portion of the desired interval. Undisturbed soil should be sampled prior to transferring the sample from the sampling equipment.
5. If conducting headspace VOC screening, soils will be placed immediately proper receptacle for screening in accordance with Woodard & Curran S-3.
6. If sub-sampling the primary sample in the field or compositing multiple primary samples in the field, place the sample into a glass or stainless steel homogenization container. Large rocks and organic debris should be removed. Each aliquot of a composite sample should be of the same approximate volume. All soil samples must be thoroughly mixed to ensure that the sample is as representative as possible of the sample media. *Samples for VOC and GRO analyses are not homogenized* (see step 4). The most common method of mixing is referred to as quartering. The quartering

procedure should be performed as follows:

- The material in the sample pan should be divided into quarters and each quarter should be mixed individually.
- Two quarters should then be mixed to form halves.
- The two halves should be mixed for form a homogenous matrix. This procedure should be repeated several times until the sample is adequately mixed.
- When using a round bowl, adequate mixing is achieved by stirring the material in a circular fashion, reversing direction, and occasionally turning the material over.

7. Transfer soil to appropriate sample containers using a stainless steel spoon taking care to completely fill containers where possible. Collect samples in their order of sensitivity to volatilization from most sensitive to least as follows: volatile organic compounds (must be collect prior to homogenization), petroleum hydrocarbons (volatile fraction), petroleum hydrocarbons (non-volatile fraction), semi-volatile organic compounds, metals, and lastly any other inorganic compounds. Fill QA/QC samples in accordance with the work plan.
8. Record sample characteristics (e.g., sample time, sample ID, location, depth, method, description, etc.) in field log. Soil classification will be made in the field in accordance with the Modified Burmister Soil Classification System.
9. Place sample container(s) and appropriate QA/QC samples as specified in the work plan into a sample cooler with ice. (Temperature should be a maximum of 4 +/-2 degrees Celsius [°C] upon laboratory receipt of samples).
10. Complete chain of custody, note that all samples are to be analyzed for percent solids.
11. Decontaminate sample equipment per Woodard & Curran S-11.

Note: If a soil sample must be collected from the bottom or sidewalls of an excavation pit or trench that is unsafe to enter on foot, soil may be collected from the bucket of the excavator. The excavator operator will scrape the desired area to be sampled, and the sampler will collect soils from the middle of the bucket that have not been in contact with the sides or bottom of the bucket.

Subsurface Soil Sampling Procedure

Subsurface soil samples may be collected using a wide variety of methods including but not limited to, split-spoon samplers, direct push core samplers, and hand augers. The Macro-Core® (MC) sampler is a solid barrel direct push sampler equipped with a piston-rod point assembly used primarily for collection of either continuous or discrete subsurface soil samples.

When using direct push sampling methods the following considerations should be taken:

- *Liner Use* – Due to the mode of operation, the samples must be collected with a liner.

- *Sample Orientation* – When the liners and associated sample are removed from the sampler, it is important to maintain the proper orientation of the sample. This is particularly important when multiple sample depths are collected from the same push. It is also important to maintain proper orientation to define precisely the depth at which an aliquot was collected. Orientation will be indicated by marking on the exterior of the liner with a permanent marker.
- *Core Catchers* – Occasionally the material being sampled lacks cohesiveness and is subject to crumbling and falling out of the sample liner. The use of core catchers on the leading end of the sampler may help retain the sample until it is retrieved to the surface.
- *VOC Sample Collection* - Observe precautions for volatile organic compound sample collection outlined in Woodard & Curran S-2.

Subsurface soil samples will be collected in accordance with the following methodology:

1. Advance MC sampler (or similar) to required depth. If an obstruction is encountered, the sampling location should be moved 2 feet from the original location until required depth is achieved. Retrieve sampler.
2. Open the sample liner.
3. Complete soil sampling procedure as per Surficial Soil Sampling steps 4 through 11 above.

Subsurface Soil Sampling Procedure (shallow water table)

The following steps will be followed when collecting soil samples in a floodplain or wetland environment from multiple depth intervals from a single sample location. These procedures assume that a device such as a hand auger or hand-held corer will be used to collect the sample. This procedure is designed to limit the degree to which water and suspended fine material from the upper sampling intervals may cross-contaminate deeper sample intervals. The maximum practical depth of sampling for this procedure may be limited to as little as 2 feet below ground surface, depending on the nature of the substrate.

1. Identify sample locations.
2. Clear ground surface of stones, vegetation, debris, etc.
3. Push or hammer a PVC or metal sleeve into the soil at the sampling location. The sleeve should be advanced to the bottom depth of the first sample interval.
4. Use a hand auger to collect soil from the surface to the bottom of the first depth interval. Sufficient soil should be collected to fill the required sample containers.
5. Use a clean stainless steel or plastic spoon to remove excess soil from the first sample interval from the sample hole.
6. Complete soil sampling procedure as per Surficial Soil Sampling steps 4 through 11 above. Ensure that samples contain a minimum of 30 percent solids. If the material has a high liquid content, allow the sample to settle and then slowly decant excess water. When decanting excess water, care should be taken to retain fine-grained

solids.

7. Repeat steps 3 through 6 for the next sample interval at the sample location.

QA/QC

QA/QC procedures are outlined in the sampling procedures discussed above. Duplicates, blanks, and spikes will be incorporated into the work plan to assess potential for sampling, shipping, and laboratory impacts on data quality.

Field duplicates are independent samples taken from the same location at approximately the same time. Field duplicate sampling is simply taking a second, independent, follow-up sample at the same location. Field duplicates provide an indicator of overall precision and measure the representativeness of the sample.

For this procedure, collect the regular sample first and then the duplicate for each analyte group in consecutive order (VOC original, VOC duplicate, SVOC original, SVOC duplicate, etc.). Field duplicates should be collected and analyzed at the frequency stated in the work plan. Treat the duplicate sample jars just as you would a normal sample.

SOP S-2

STANDARD OPERATING PROCEDURE FOR THE COLLECTION AND PRESERVATION OF SOIL SAMPLES FOR ANALYSIS OF VOLATILE ORGANIC COMPOUNDS (Method 5035A)

Woodard & Curran, Inc.

Summary

Soil samples collected for analysis of Volatile Organic Compounds (VOCs) will be collected and preserved in accordance with the requirements of USEPA Method 5035A guidance.

Soil samples will be collected or preserved as soon as possible following collection. Care should be taken to limit the exposure of the soil samples to environmental stresses such as wind, rain, and direct sunlight.

Soil samples will be preserved or analyzed within 48 hours of sample collection (Note: freezing the sample stops the clock until thawing occurs). Care should be taken to adequately schedule sample pick up or delivery.

Equipment:

- Field logbook or sampling sheets.
- Pre-weighed, pre-preserved sample containers; 1 methanol preserved and 2 sodium bisulfate preserved VOA vials per sample interval (or other preservation as required by the work plan) and 1 additional non-preserved sample container.
- Wide mouth soil jars for headspace determination.
- Sample labels and Chains of Custody.
- Field Scale.
- Syringe type soil sampling device.
- Insulated cooler and ice.
- Decontamination equipment and supplies.
- Personal protective clothing and equipment as required by the site-specific HSP.

Soil Sampling Procedure

Each soil sample will be collected and preserved in a timely manner. All soil samples should be collected in accordance with the requirements of the work plan.

1. Perform test sampling as necessary to provide collection of the correct weight of sample within each soil syringe.
2. Weigh each individual VOA vial and record the results, unless vial is pre-weighed by the laboratory.
3. Collect soil sample as per Woodard & Curran S-1.
4. Perform visual inspection of the sample.
5. Using the soil sampling syringe, collect 5 grams (or as specified by laboratory and/or work plan) of soil and extrude sample into the first sodium bisulfate preserved VOA vial for low-level VOC analysis.

6. Repeat Step 5 for the second low level VOC analysis vial.
7. Using the soil sampling syringe collect 10 grams of soil (or as specified by laboratory and/or work plan) and extrude sample into the Methanol preserved VOA vial.
8. If vials were not pre-weighed at the laboratory, weigh each VOA vial and record the results to meet required sample weight.
9. Collect at least 20 grams of soil for moisture content analysis.
10. Record samples (e.g., sample ID, location, depth, method, description, etc.) in the field logbook or sampling sheets.
11. Place sample container(s) and QA/QC samples as specified in the work plan into a sample cooler with ice. (Temperature should be a maximum of 4 +/- 2 degrees Celsius [°C] upon laboratory receipt of samples).
12. Complete chain of custody.
13. Decontaminate sample equipment per the work plan.

QA/QC

QA/QC procedures should be followed in accordance with the site-specific work plan. Duplicate, matrix spike, and matrix spike duplicate samples should be collected as necessary by alternately filling the appropriate sample containers for the primary and QA samples.

SOP S-3

STANDARD OPERATING PROCEDURE FOR HEADSPACE FIELD SCREENING

Woodard & Curran, Inc.

This guideline describes the procedure for performing soil headspace measurements on soil samples collected during soil sampling/drilling/boring activities.

Equipment:

- Glass jars or Ziploc type bags
- Field book or sampling logs
- Aluminum foil
- Hand held photoionization detector (PID)
- Calibration gas (100 ppm isobutylene)
- Tedlar bag
- Short piece of plastic tubing
- Sample containers
- Field logbook
- Decontamination equipment and supplies
- Personal protective equipment as required by the site-specific HSP
- Cooler with ice

Procedure

Soil samples collected during drilling will be analyzed with a photoionization detector (PID) by the soil headspace screening procedure. Note: the following calibration steps are for a commonly used PID (e.g., MiniRAE 2000 or equivalent). Specific calibration steps will differ based on the individual unit used.

Calibration

- Select "Fresh Air Cal" from the calibration sub-menu.
- Ensure that the unit is in an area free of organic vapors.
- Press the "Y/+" key to begin the calibration.
- When the calibration is complete, return to the calibration sub-menu.
- Fill a Tedlar bag with 100 ppm isobutylene.
- Connect the PID to the Tedlar bag with a short piece of plastic tubing.
- Select "Span Cal?" from the calibration sub-menu.
- Attach the Tedlar bag to the intake of the PID. The unit will begin to count down while calibrating.
- The instrument will indicate when calibration is complete.
- Check the PID reading against the span calibration gas, the reading should be within +/- 10% of the known span gas concentration.

Sampling

- Once PID calibration is complete, fill glass jar or Ziploc bag half way with the soil sample to be analyzed.
- Close the sample container.
- Allow headspace development for 10 minutes at room temperature. Vigorously shake the sample for 15 seconds at the start and end of the headspace development period.
- Remove the screw cap and puncture the foil seal or bag with the instrument sampling probe.
- Record the highest meter response as the headspace concentration. Response should be observed within 3-5 seconds (or as specified by operators manual). Erratic meter response may be due to high organic levels, humidity, and/or moisture.

QA/QC

The calibration of the PID should be checked at the end of the field day by taking a measurement of the span calibration gas. The reading should be within +/-25% of the known concentration. If the observed value falls outside of this range, record this in the field notes and the data may be qualified as "estimated" with the direction of bias. If the calibration check grossly exceeds the criteria, (i.e. +/-50%), the Project Manager will be notified and will make the determination as to whether to reject the data or resample.

SOP S-6

STANDARD OPERATING PROCEDURE FOR DRILLING, MONITORING WELL INSTALLATION AND MONITORING WELL DEVELOPMENT

Woodard & Curran, Inc.

Summary

Soil and bedrock borings are advanced to investigate subsurface conditions. In nearly all cases, a drilling subcontractor will be retained to advance subsurface borings and install monitoring wells. Many of the steps presented below will be completed by the drilling contractor. Drilling operations can be hazardous to inexperienced staff, proper training and supervision is critical. This SOP covers the use of a drilling rig to advance borings by various methods (e.g., hollow stem auger, drive and wash, direct-mud rotary, direct-push, rotosonic, coring, and hand augering). Specific drilling methods will be determined based on field observations such as drill rig access and formation materials as well as the data quality objectives for the data to be collected. Materials generated during boring and well installation activities should be managed in accordance with the work plan. Monitoring wells may be installed in borings based on scope of work plan. Monitoring wells are used to collect groundwater samples and evaluate hydraulic conditions.

Equipment:

- Drilling or auguring equipment appropriate to site conditions, drilling depth, and other project requirements.
- Drill bits/tooling appropriate for the expected soil and rock type(s) to be encountered.
- Instrumentation appropriate for high-resolution subsurface characterization (if applicable). This equipment are used in direct-push applications to obtain high-resolution hydraulic and geochemical data. These instruments are often proprietary technologies provided by drilling contractors.
- Threaded flush-joint riser pipe of an approved material [stainless steel, polyvinyl chloride (PVC]. **(NOTE: No glues are permitted.)**
- Threaded flush-joint slotted screen of an approved material (stainless steel, PVC) to meet design criteria. **(NOTE: No glues are permitted.)**
- Properly sized and washed filter pack material (quartz sand) in sufficient volume to meet well design criteria.
- Bentonite
- Cement-bentonite grout (if required).
- Photoionization detector.
- Explosimeter (if applicable).
- Steel surface casing (if required).
- Steel protective casing with locking cap.
- Tremie pump and pipe.
- Personal protective clothing and equipment as required in the site-specific HSP.
- Weighted measuring tape.

Overburden Drilling and Well Installation Procedure

The following steps will be followed when advancing soil borings and installing monitoring wells:

1. Advance the borehole in overburden deposits to the required depth. If soil samples are to be collected for laboratory analysis or classification, Woodard & Curran S-1 shall be followed. If the drill rig is equipped with high-resolution direct sensing equipment (e.g., membrane interface probe [MIP], cone penetrometer [CPT]), real-time data may be used to assess modifications to the drilling program.
2. If installing a monitoring well, the borehole should be drilled slightly deeper than required for the combined length of casing and screen.
3. Withdraw the drill rods and bit through the auger flights or steel casing. Check the borehole depth with a weighted tape.
4. Lower the casing string into the drill casing.
5. Install the filter pack. Six inches or more of filter pack material should be spotted at the bottom of the hole, under the screen. Filter pack will be installed to 2 to 3 feet above the top of the screen.
6. Check the depth to the top of the filter pack with a weighted tape.
7. Install bentonite onto the top of the filter pack using caution to avoid bridging. The bentonite seal will be at least 2 feet thick unless restricted by depth to the ground surface. The bentonite seal should be adequately hydrated prior to continuation of well construction.
8. When appropriate, a cement-bentonite grout (Volclay or equivalent) will be used as the annular seal, grout will be mechanically mixed with water. For shallow wells (approximately < 35 feet) granular bentonite may be substituted for grout. In some locations, the use of native material to fill the annular space is appropriate.
9. Tremie the grout into the annulus using a tremie pipe from the bottom. Slowly withdraw the tremie pipe as the annulus fills. Grout the well to within 2 to 3 feet of the surface but not higher than the average frost line. Compare actual volume of grout placed with calculated volume. Both should be annotated in the field logbook.
10. After installing grout, dismantle and clean tremie equipment.
11. Install protective casing (road box or standpipe). A concrete pad may be added. If a pad is used, it should be installed so that it slopes away from the wellhead in all directions with a minimum thickness of 4 inches. If weather conditions warrant, cover the concrete until cured. Lock the well cover.
12. If the well design specified guard posts, dig the holes and set the guard posts in concrete separate from the concrete pad. Posts and concrete must extend to a depth of 2 feet.

13. Record the appropriate construction/completion information in the field logbook and on the appropriate monitoring well installation.
14. The well identification should be marked on the protective casing and PVC cap.

Bedrock Drilling

Advancement of bedrock boreholes may occur using a variety of drilling techniques (e.g., air rotary, percussion hammer, rotosonic, coring). These methods are preceded by steps used to isolate the overburden and bedrock aquifers. Discuss project objectives with the drilling contractor prior to bedrock borehole advancement. Frequent communication with the drilling contractor is required to understand fugitive data and observations which may indicate water-bearing zones and rock competency based on fluid loss, changes in recirculation water, downhole drilling rates, or any other conditions which may suggest intersection of key bedrock features or changes in rock type.

1. Advance the borehole in overburden deposits to the top of bedrock. Use telescopic methods during casing advancement as needed. Extend boring into bedrock 3-5 feet for confirmation. Depending on the method selected review drill cuttings, core runs, etc. to determine competent bedrock has been reached.
2. Firmly seat outer casing in bedrock. Depending on project objectives, casing may be grouted in place and allowed to cure prior to continuation of bedrock drilling. In lieu of grouting, outer casing may be seated by percussive or air rotary methods to seat casing in competent rock. Confirm compatibility of drill casing with tooling used to extend the borehole in bedrock to support evacuation of drill cuttings and core barrel removal.
3. For grouted casing, wait a minimum of 24-hours for the grout to cure prior to resuming borehole drilling.
4. Prepare drill tooling for continuation of the bedrock borehole.
5. Resume drilling in bedrock based on selected method. For air rotary methods, observe cuttings to evaluate lithologic changes. If coring is selected, advance the core barrel in minimum 5-foot intervals (or “runs”) with care taken to remove cores in the correct orientation during transfer to dedicated boxes for logging by the field geologist.
6. Note any changes in water loss or difficulty removing drill cuttings.
7. Extend the drill string as necessary to the desired depth
8. Once the target depth is achieved, remove any residual cuttings from the bottom of the borehole with shortened drill strokes to ensure all cuttings/rock is removed. Flush the borehole with clean water and observe changes in recirculation water clarity to determine effectiveness. If the borehole is slightly overextended, additional filter sand may be added to depth.

Well Development

Monitoring wells are developed to remove skin (i.e., near-well-bore formation damage), to settle and remove fines from the filter pack, and to restore/improve the hydraulic connection between the well and the aquifer. When bentonite grout is used to seal the annular space, wells should not be developed for 48 hours after installation. However, wells may be developed before grouting if conditions warrant.

Equipment Needed:

- Pump (whale pump, peristaltic pump, or Grundfos pump) and pump tubing (if overpumping)
- Surge block (if surging)
- Water-level meter.
- Tubidimeter.
- Personnel protective equipment as specified in the site-specific HSP.
- Decontamination supplies.
- Disposal drums, if required.

Procedure

The following steps will be followed when developing wells:

1. Open and check the condition of the wellhead, including the condition of the surveyed reference mark, if any. Use a photoionization detector (PID) at wellhead to determine the presence of VOCs (if applicable).
2. Determine the depth to static water level and depth to bottom of the casing.
3. Prepare the necessary equipment for developing the well. There are a number of techniques that can be used to develop a well. Some of the more common methods are surge and purge and overpumping.
    - Surge and Purge
        - The surge block should be moved up and down the screened well interval several times. The objective is to move fine sediment from the filter pack into the well casing.
        - After several rounds of surging, a submersible pump is used to remove fine material from the well. The pump should be moved up and down the screened interval of the well until clear water is produced.
    - Overpumping
        1. Begin pumping water from the well at a high enough rate that the water level in the well drops as low as possible.
        2. Allow the well to recharge.

3. Continue overpumping and recharging the well until sediment free water is produced.

   Overpumping is a less vigorous well development method than surging. Previous well development techniques at the site should be reviewed to determine which methods are most successful and appropriate. Surging should not be used in formations with a high clay content due to the potential for the well screen to become clogged.

4. Continue well development until produced water is clear and generally free of suspended solids. A turbidimeter may be used to assist with this determination.
5. Remove the pump assembly or bailers from the well, decontaminate, and clean up the site.
6. Lock the well cover before leaving. Dispose of produced water as required by the project work plan.

Consistent with standard practice and to preclude collection of samples that are not representative of the groundwater. Monitoring wells should not be sampled within a minimum of 24 hours of development. Greater than 48 hours between development and sampling is preferable.

SOP S-7

STANDARD OPERATING PROCEDURE FOR
LOW STRESS/LOW FLOW
GROUNDWATER SAMPLING

Woodard & Curran, Inc.

Groundwater samples will be collected in general accordance with USEPA Region 1 *Low Stress (low flow) Purging and Sampling Procedure for the Collection of Ground Water Samples from Monitoring Wells* (EPA, July 30, 1996, revised January 19, 2010) (attached). Groundwater samples will be collected in pre-preserved laboratory provided sample containers. Prior to initiating groundwater sampling field activities, a review of the requirements for groundwater sample containers and preservatives in the work plan will be conducted.

Equipment:

- Adjustable rate submersible or peristaltic pump as specified in the work plan.
- Polyethylene tubing (new or dedicated for each location).
- Water level measuring device capable of measuring to 0.01 foot accuracy.
- Flow measurement supplies (graduated cylinder and stop watch).
- Pump power supply.
- Personal protective clothing and equipment as required in the site-specific HSP.
- Photoionization Detector.
- YSI, Quanta or similar multi-meter with flow cell (or separate individual meters) to measure: Temperature, specific conductance, pH, ORP, and dissolved oxygen (DO).
- Lamotte or similar turbidimeter as required by the work plan.
- Calibration standards for field water quality parameters.
- 0.45 micron filters
- Appropriate sample containers with required preservative and labels.
- Field logbook or sample sheets.
- Cooler with ice.
- Three way valve — used with short section of tubing to bypass sampling train for turbidity readings. Groundwater is collected from the valve when it's opened rather than from the discharge tubing of the flow cell. This eliminates collection of fine materials that have accumulated in the flow cell during the course of the purging process.
- Decontamination supplies.
- Well keys.
- Boring/ monitoring well logs for appropriate sampling locations.

Sampling Procedure

The steps listed below will generally be followed when collecting and preserving groundwater samples.

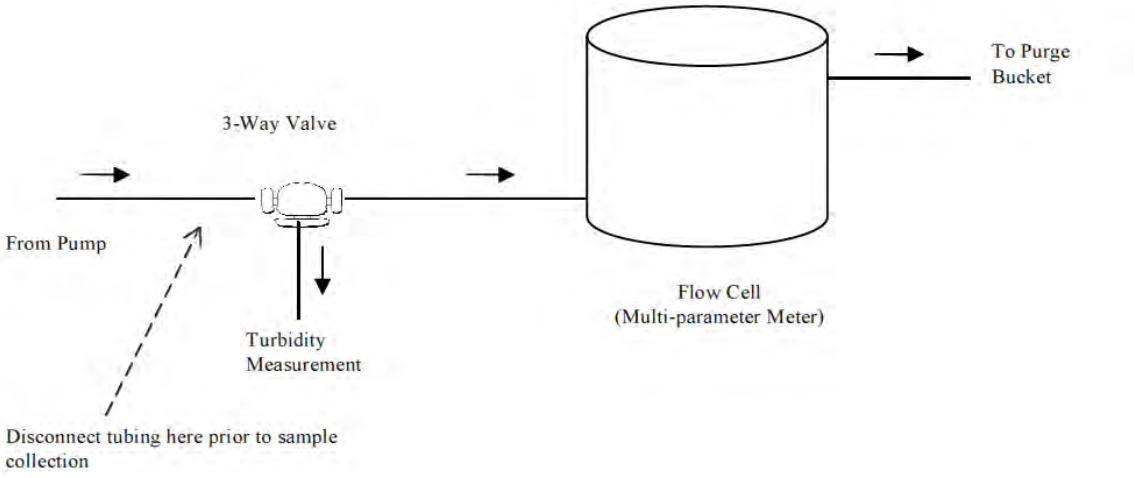
1. The multi-parameter device and turbidimeter should be calibrated at the beginning of each sampling day in accordance with the manufacturer's instructions. Calibration results should be within the stabilization value for the given parameter standard (I.e. Within +/- 0.1 SU for pH 7)

2. Measure and record water level in accordance with Woodard & Curran S-8.
3. Slowly lower submersible pump or pump intake tubing to pre-determined depth. Do not

bottom measure pump intake depth (i.e. lower pump/tubing to bottom of well and pull back to depth). If sampling from a borehole equipped with a multi-level sample port system, use the dedicated tube for the intended sample depth.

3. Set up remainder of sample train including flow cell, instrumentation, and purge buckets (See Figure 1).
4. Start pump, begin purge at low flow rate, and monitor drawdown. Initial purging activity should focus on minimizing drawdown and stabilizing water level in the well. Stabilized purge rate should be ideally between 50 and 400 ml/min. In accordance with USEPA Low Flow Sampling Guidance, the flow rate must be able to "turn over" at least one flow-through-cell volume between measurements.
5. Purge the well while monitoring and recording the following parameters in the field logbook or on the sample sheet at 3 to 5 minute intervals: water level (drawdown); pumping rate; dissolved oxygen (DO); temperature; specific conductivity (SpCond); pH; oxidation-reduction potential (ORP); and turbidity. Continue purging until field parameters have stabilized. Stabilization is considered achieved when three consecutive reading taken between 3 to 5 minutes apart are within the following limits:
    - Temperature — 3%
    - Specific Conductance — 3%
    - DO — 10% for values greater than 0.5 mg/L; if three DO values are less than 0.5 mg/L, consider the values as stabilized.
    - Turbidity — 10% for values >5 NTU; if three Turbidity values are less than 5 NTU, consider the values as stabilized.
    - pH +/- 0.1 standard unit
    - ORP +/- 10 mV

    The stabilization goals may not be achievable in all geological formations. A reasonable effort will be made to achieve stabilization of field parameters. However, if stabilization is not achieved within 60 minutes, it will be noted in the field log book or on the field sheet, and samples will be collected.
6. Disconnect flow cell and collect groundwater samples from pump discharge tubing in appropriate sample containers as specified in the work plan. During sample collection, allow sample to flow down inside of container to minimize turbulence.
7. Place labeled sample container(s) and appropriate QA/QC samples as specified in the work plan into a sample cooler with ice. (Temperature should be a maximum of 4°C +/- 2°C upon laboratory receipt of samples)
8. Record samples (e.g., sample ID, location, method, etc.) in the field logbook or on sample sheets.
9. Complete chain of custody and include in sample shipment.
10. Check equipment calibration at the completion of each sampling day.



QA/QC

QA/QC procedures are outlined in the sampling procedures discussed above. Duplicates, blanks, and spikes have been incorporated into the work plan to assess potential for sampling, shipping, and laboratory impacts on data quality.

Field duplicates are independent samples taken from the same location at approximately the same time. Field duplicate sampling is simply taking a second, independent, follow-up sample at the same location. Field duplicates provide an indicator of overall precision and measure the representativeness of the sample.

For this procedure, collect the regular sample first and then the duplicate for each analyte group in consecutive order (VOC original, VOC duplicate, SVOC original, SVOC duplicate, etc.). Field duplicates should be collected and analyzed at the frequency stated in the work plan. Treat the duplicate sample bottles just as you would a normal sample.

SOP S-8

STANDARD OPERATING PROCEDURE FOR WATER LEVEL MEASUREMENTS

Woodard & Curran, Inc.

Water level measurements will be collected to measure and monitor groundwater flow direction and hydraulic gradient. Water levels will be measured at each existing and accessible monitoring wells, temporary well points, and stream piezometers as required.

Equipment:

- Electronic water level indicator or chemical/water interface probe (Solonist Models 101 or 122, or similar instrument) capable of measuring to 0.01 foot.
- Photoionization detector (PID).
- Well keys.
- Miscellaneous items such as pens, markers, paper towels, hand broom, clipboard, etc.
- Field Log Book or sample sheets.
- Personal Protective Equipment as outlined in the site-specific HSP
- Decontamination supplies

Procedure

The following steps will be followed when performing groundwater elevation monitoring.

- Prior to starting water elevation monitoring, decontaminate the water level meter or interface probes and check that it is in proper working condition.
- If multiple field crews perform elevation monitoring, calibration measurements will be conducted at the beginning of the measurement round. Calibration is completed by taking a measurement in a single location, by each of the field crews, using their assigned water level meter or interface probe. This process will evaluate if there are variations in the instruments or in the manner in which each of the field crews reads the tape measure scale on the instruments.
- Prior to opening the protective casing or flush mount roadbox, clear away dirt, debris, or liquid from the vicinity of the monitoring well. Once the protective cover is removed, clean/remove debris from the interior of the casing/roadbox and around watertight seals. During this process, any damage to the roadbox, protective casing, or monitoring well should be recorded in the field book or sample sheet.
- Measurements shall be collected from a previously marked measuring point on the riser (groundwater monitoring wells are typically marked on the PVC riser).
- If the highest point on the riser is too deep within the well casing to reach and/or read the measurement on the water level meter tape, the depth to water measurement shall be collected from the top of the protective casing. If not marked, measure to the highest point on the riser.
- Measure and record the depth to water (DTW). If non-aqueous phase liquid (NAPL) is known or suspected in a monitoring well, use an interface probe to check and measure the presence of a NAPL layer.
- Secure the protective casing or flush mount roadbox.

QA/QC

Two measurements shall be collected at each location to verify that the water level was at static conditions as well as confirm that the monitoring well was not under pressure (positive or negative) when the J-plug was removed. The measurements shall be collected a minimum of 10 seconds apart. If the measurements are not equal, then continue measuring the water level in 10-second intervals until a stable reading (0.01 feet difference) is achieved.

SOP S-11

STANDARD OPERATING PROCEDURE FOR EQUIPMENT DECONTAMINATION

Woodard & Curran, Inc.

Decontamination of field equipment is necessary to ensure the quality of samples by preventing cross-contamination. In addition, decontamination reduces health hazards and prevents the spread of contaminants off-site.

Equipment:

Large/heavy Equipment (i.e., Drill rigs, backhoes, augers, drill pipe, bits, casing, and screen):

- High-pressure pump with steam-spray unit.
- Stiff-bristle brushes.

Small/sampling equipment (i.e., Split spoons, bailers, bowls, and pumps):

- Non-phosphate detergent (Alconox).
- Polyethylene sheeting.
- Stiff-bristle brushes.
- Wash bottles or manual pump sprayer.
- Methanol.
- Distilled or Deionized water.
- Tap water.

Heavy Equipment Procedure

The following steps will be followed when decontaminating large/heavy equipment:

1. The drilling contractor will construct a decontamination area, if required, at a designated area on site of 6-mil polyethylene (or other suitable material), large enough to capture decontamination fluids. Depending on site conditions and nature of decontamination fluids, equipment may be decontaminated at each exploration location and decontamination fluids allowed to infiltrate back into the ground.
2. Drill rigs and tools will be cleaned between each location and prior to the initiation of any sampling.
3. Spray areas exposed to contaminated soils using steam or high-pressure sprayer. Be sure to spray down all surfaces, including the undercarriage.
4. Document that decontamination was performed in the appropriate log book.
5. Decontamination fluids will be handled and disposed of in accordance with the work plan.

Sampling Equipment Procedure

All expendable equipment (e.g., sample tubing, probe sleeves, etc.) will be replaced prior to collection of each sample. Reusable equipment (e.g., pumps, hand augers, probing equipment, etc.) that comes in direct contact with the sample will be decontaminated according to the procedures below. Use the following procedure prior to collecting the first sample, between samples, and after the final sample:

1. Set up a decontamination line. The decontamination line should progress from "dirty" to "clean", with an area for drying decontaminated equipment. The decontamination line should be set up on polyethylene sheeting.
2. Wash the item thoroughly in a bucket of soapy water (tap water). Use a stiff-bristle brush to dislodge any clinging dirt. Disassemble any items that might trap contaminants internally before washing. Do not reassemble until decontamination is complete.
3. Rinse the item in a bucket containing clear tap water. Rinse water should be replaced as needed.
4. Flush and rinse with distilled or deionized water
5. Flush and rinse with methanol if samples are being collected for certain organic analyses. Allow to air dry
6. Document that decontamination was performed in the appropriate logbook or sample sheet.
7. Decontamination water will be managed in accordance with the work plan.

Pump Procedure

The following steps will be followed when decontaminating pumps:

1. Pumps should be set-up in the same configuration as for sampling. Flush the pump with potable water.
2. Submerge pump intake (or pump if submersible) and all downhole wetted parts (tubing, piping, foot valve) in soapy water. Pump a minimum of three pump assembly volumes of soapy water through the entire assembly. Note: If dedicated tubing is used for monitoring wells, the tubing will not need to be decontaminated.
3. Replace soapy water with potable water. All downhole wetted parts must be immersed in the potable water rinse. Pump a minimum of three pump assembly volumes of clean water through the entire assembly.
4. Proceed with Sampling Equipment Procedure steps 3 through 7 above.

QA/QC

The SSO or designated alternate will monitor decontamination procedures to ensure that they have been completed according to the procedures outlined above. Equipment blanks will be collected and analyzed throughout the program to determine the effectiveness of decontamination procedures. Blank number and frequencies are presented in the work plan.

APPENDIX C

KEY INFORMATION FROM HISTORICAL INVESTIGATIONS AND REMEDIAL ACTIVITIES

APPENDIX C.1

SUMMARY OF PREVIOUS INVESTIGATIONS AND REMEDIAL ACTIVITIES (EXCERPTED FROM WOODARD & CURRAN'S 2019 PERIODIC SUMMARY REPORT)

3. SUMMARY OF PREVIOUS INVESTIGATIONS AND REMEDIAL ACTIVITIES

Environmental investigation and remediation activities have been ongoing at the site since the late 1980s. The following provides an overview of major activities conducted at the site based on a review of available historical documents:

1987 – 1988 Hydrogeologic Study. In March 1986, suspected subsurface contamination was encountered on site during construction of a sewer main (in AOI # 2 and #3). Soil and groundwater samples were subsequently collected from the excavation area and reportedly contained high concentrations of TCE and its degradation products, in addition to other common industrial solvents. The New Hampshire Water Supply and Pollution Control Division requested that the Town of Salem submit a work plan to characterize the contamination and prevent any migration of the contamination off-site. A field investigation was conducted from approximately July through October 1987, and a report summarizing the findings of the investigation was submitted in March 1988 (GZA 1988). The report identified the presence of a potential contaminant source area located in or near the northwestern part of the wooded portion of the site (in AOI # 3). The report also identified the presence of a groundwater contaminant plume in the central portion of the site (AOI #1), with VOC contamination apparent in both the upper and lower hydrogeologic units. Contaminant constituents were predominantly TCE and its degradation constituents, other chlorinated organic solvents, and various aromatic hydrocarbons associated with petroleum. Additional investigations were recommended to further characterize groundwater hydrology and evaluate the extent, migration, and fate of contaminants at the site.

1988 – 1989 Phase II Hydrogeologic Study. Based on the results of the previous hydrogeologic study, a supplemental field investigation was conducted from approximately September 1988 through February 1989, and a report summarizing the findings of the investigation was submitted in December 1989 (GZA 1989). The report identified additional source areas for groundwater contamination: 1) two areas of subsurface soil contamination, and 2) two stockpiles that were constructed during excavation activities completed for sewer line construction. These sources were designated the north and south contaminates soils areas (AOI #3), respectively (GZA 1997). The report recommended remedial action to control and treat contaminated soil and groundwater at the site, and also recommended implementation of a groundwater and surface water monitoring program for the site (GZA 1989).

1992 – 1996 Remedial Design Program. Based on the findings of previous investigations and at the request of NHDES, a two-part remedial design program was implemented for the site. Part 1 was conducted from January to July 1992 and included a water quality and source area assessment to further delineate the nature of subsurface contamination at the site (GZA 1997). A memorandum summarizing this assessment was submitted on July 17, 1992, the primary conclusions of which were 1) site groundwater was likely not impacting off-site receptors, and 2) soil contamination within the northern and southern contaminated soil areas (AOI #3) had extended to groundwater (GZA 1997). A bioremediation screening study was then conducted in 1995 (Part 2 of the Remedial Design Program), the results of which were summarized in a July 18, 1996 Status Report provided to NHDES (GZA 1996). The findings of the screening study indicated that VOCs were likely undergoing intrinsic bioremediation (i.e., natural attenuation) at the site driven by historic co-disposal of sludge/septage (GZA 1996). A subsequent lab-scale feasibility study was initiated in April 1996 and completed in September 1996, as summarized in the Remedial Action Plan (RAP) submitted in April 1997 (GZA 1997).

April 1997 Remedial Action Plan. A RAP for the site was submitted in April 1997 and approved by NHDES on June 20, 1997. Based on the results of previous investigations and the lab-scale feasibility study, the proposed remedial action consisted of enhanced bioremediation with natural attenuation to remediate groundwater (GZA 1997). Remediation of residual vadose zone soils and the two stockpiles in AOI # 3 was deemed unnecessary based on the results of additional sampling conducted in July 1996 and an associated Residual Soil Source Evaluation submitted as part of the RAP (GZA 1997).

1997 – 1999 Pilot-Scale Enhanced Reductive Dechlorination (ERD). Pilot-scale ERD injections began in July 1997 in the southern portion of the site (AOI #3. A report summarizing the results of the pilot study was submitted on May

26, 1999, and recommended implementation of a full-scale bioremediation system (GZA 1999a). A work plan for expanding the pilot-scale system to a full-scale system for the was submitted on September 29,1999 (GZA 1999b) and approved in November 1999 (NHDES 1999).

2000 – 2007 Full-Scale ERD (AOI #3. Full-scale ERD was implemented in the southern site portion between 2000 and 2003 (lower hydrogeologic unit) and 2000 and 2007 (upper hydrogeologic unit) (GZA 2005, GZA 2015) in accordance with the 1999 work plan. At the request of NHDES, a data gap investigation consisting of additional subsurface investigation and a conservative tracer study was conducted between 2004 and 2006 to further evaluate the extent of VOC contamination in groundwater and the approximate area of influence of the full-scale system (GZA 2006). The full-scale upper hydrogeologic unit system ceased operation in September 2007 due to the results of data gap investigations conducted during 2006 and 2007, which indicated the primary source area was located to the east and upgradient of the injection areas (GZA 2015).

2004 Data Gap Investigation. A work plan was submitted in May 2003 for supplemental investigation focused on the northern site portion (AOI #2) to address issues raised by the March 2002 Preliminary Site Assessment (GZA 2003). The scope of work included investigation of PCBs in basement water in the main building and additional subsurface investigation in the northern site portion. The work was conducted from January to November 2004 and results were reported in the 2004 Annual Summary Report (GZA 2005).

July 2005 RAP Update. A RAP update was included in the 2004 Annual Summary Report to address the contamination identified in 2004 in the northern portion of the Site (GZA 2005). The RAP update proposed implementation of an ERD pilot study to evaluate whether full-scale ERD could be expanded to treat the lower hydrogeologic unit in the northern portion of the Site (AOI #2). The RAP update also proposed work to address PCB-contaminated water in the basement of the main building.

2006 Source Area Data Gap Investigation. A source area data gap investigation was conducted from approximately April through October 2006, the results of which were summarized in a letter report prepared in June 2007 (GZA 2007). The goal of the investigation was to further evaluate the extent of an identified TCE “hotspot” in the vicinity of well couplet GZ-405U/L in the southern portion of the site (AOI # 2). The investigation was conducted at the Town’s request due to previous detection of elevated chlorinated VOC concentrations in groundwater in the vicinity of a constructed wetland as part of improvements to Route 93. The constructed wetlands were not completed as part of the Route 93 project.

2006 – 2008 ERD Pilot Study, Lower Hydrogeologic Unit. An ERD pilot study was initiated in October 2006 with injections into the lower hydrogeologic unit focused on the identified TCE hotspot in AOI # 2. Early results of the pilot test showed increasing TCE concentrations, which were thought to be due to TCE mobilization or dissolution of DNAPL perhaps related to cosolvency effects (GZA 2012). The study was terminated in 2008 due to unexpected subsurface conditions, which indicated the TCE hotspot was much larger than anticipated (GZA 2009).

2007 Data Gap Investigation. During 2007, a data gap investigation was conducted to further refine the CSM relative to the primary TCE source area in AOI #2 (GZA 2017). The results were reported to NHDES in a Data Gap Investigation Report submitted on June 9, 2008 (NHDES 2009).

2009 – 2014 Supplemental Site Investigations. In response to NHDES comments on the 2007 Data Gap Investigation (NHDES 2009), a work plan was submitted to NHDES in June 2010 proposing various additional evaluation and investigation activities related to PCB-contaminated water in the basement of the main building, effects of ERD injections on water quality, potential impacts to groundwater north of Spicket River, presence of source mass in shallow soils, delineation of the source area, and presence of DNAPL. Comments on this work plan were received from NHDES in January 2011, and results of these activities were reported in 2010 – 2011 Annual Summary Report (GZA 2012). Subsequent letters from NHDES were received on July 1, 2013 commenting on the 2010 – 2011 Annual

Summary Report and February 25, 2014 commenting on the 2012 Annual Summary Report, both of which requested additional related investigation activities. These additional activities were largely conducted in 2013 and 2014. Additional sampling activities were also conducted in 2013 and 2014 to further evaluate the impacts of VOCs in groundwater in the vicinity of potentially occupied structures.

2013 - 2015 ZVI/ERD Treatability and Pilot Studies. Beginning in approximately July 2013, a laboratory-scale ZVI/ERD treatability study was conducted for 12 weeks. Based on the results of this study, a work plan was submitted in May 2014 for a field-scale pilot study in the upper hydrogeologic unit source area, the objective of which was to further evaluate the effectiveness of combined ZVI and ERD treatment for potential full-scale implementation (GZA 2014). Results of the laboratory-scale study were favorable according to GZA and were reported in a memorandum attached to pilot study work plan. The work plan was approved by NHDES on August 12, 2014 and the pilot test was implemented in October 2014. Results of the pilot study, which indicated that a full scale ERD/ZVI alternative were feasible for remediation of chlorinated VOCs in the upper hydrogeologic unit, are discussed in detail in the August 2015 RAP addendum and the 2014 annual summary report.

2014 – 2015 Vapor Intrusion Study and Groundwater Management Zone (GMZ) Evaluation. In September 2014, a work plan was submitted to evaluate the transport of VOCs west and northwest of the Spicket River (AOI #5). This work was proposed based on the results of well rehabilitation and installation activities conducted in 2013 and 2014. The proposed activities included soil vapor sampling, installation and sampling of groundwater monitoring wells, and collection of pore water samples from beneath the Spicket River. A letter report summarizing the results of these activities was submitted in February 2015. The report generally concluded that the existing GMZ was adequate, and that the data collected did not indicate potential for vapor migration to buildings on residential properties west of the Spicket Rivet. Sediment pore water samples were collected in July 2015 and indicated that site VOCs were discharging to the Spicket River (GZA 2017).

August 2015 RAP Addendum. A RAP addendum was submitted in August 2015 and approved by NHDES in October 2015 (NHDES 2015). The addendum was prepared following supplemental remedial pilot testing (as discussed above) and also addressed petroleum-related VOC soil and groundwater contamination, in addition to TCE-related contamination at the site. The proposed remedial approach included a combination of in-situ ZVI and ERD treatment, along with excavation of vadose zone soils and possible excavation of soils in the upper hydrogeologic unit. The addendum proposed the use of MIP and direct push soil sampling to further characterize the primary source area in order to finalize the remedial design (GZA 2015).

November 2015 MIP survey and June 2016 Soil Sampling. A MIP survey and confirmatory soil sampling were completed in November 2015 and June 2016, respectively, to further delineate the source area. Results were incorporated into the revised CSM included in the 2015 and 2016 Periodic Summary Report (GZA 2017).

August 2016 Hydraulic Testing. Hydraulic testing was conducted in the upper hydrogeologic unit of the source area to evaluate the feasibility of dewatering and groundwater treatment for potential soil excavation alternative (GZA 2017).

May 2017 Work Plan for Removal and Treatment of PCB-Impacted Water. A work plan outlining planned dewatering activities and treatment of PCB-impacted water from site structures was submitted on May 26, 2017. Water samples collected from site structures were collected in April 2017 and confirmed the presence of low levels of PCBs. Activities described in the work plan were originally scheduled to be completed in mid-2017.

TABLE 3
ZVI/BIOTIC ERD PILOT STUDY PERFORMANCE MONITORING SUMMARY
Former Wastewater Treatment Facility
Salem, New Hampshire
NHDES #198405033

Notes:
1. The New Hampshire Ambient Groundwater Quality Standards (NH AGQS) are included in Table 600-1 (Section 603.03) of the New Hampshire Code of Administrative Rules Env-Or 600 Contaminated Site Management.
2. "µg/L" indicates micrograms per liter; "mg/L" indicates milligrams per liter; "mV" indicates milliVolts.
3. "na" indicates that the respective standard has not yet been established.
4. "ND" indicates that the respective contaminant was not detected above the laboratory reporting limit.
5. Values in bold indicate the parameter was detected; shading indicates the detected value exceeded AGQS; italics indicates the detected value exceeds the GW-2 Groundwater to Indoor Air screening levels included in the NHDES Vapor Intrusion Guidance.
6. "<" indicates that the respective parameter was not detected above the analytical laboratory Reporting Limit (RL).
7. "NT" indicates the parameter was not sampled.
8. "EI" indicates the reporting limit was elevated due to matrix interference.
9. On October 2, 2014 methane, ethene, ethane, total organic carbon, nitrate, chloride, and dissolved manganese, were analyzed for in monitoring wells GZ-601U, GZ-606U, GZ-802US, GZ-802UD, GZ-TW-3, and GZ-TW-4. The results were are were recorded under 9/25/204.
10. Sulfate was analyzed using Method 9038 for each round of sampling with the exception of March 2015, for which both Method 9038 and Method 300.0 were used.

From "Remedial Action Plan Addendum," prepared by GZA, dated August 20, 2015

TABLE 5A NOTES
NORTHERN SITE PORTION, LOWER UNIT

Former Wastewater Treatment Facility
Salem, New Hampshire
NHDES #198405033

Notes:

1. Sample Round Nos. 1 through 4, 6, and subsequent rounds were carried out by GZA GeoEnvironmental, Inc. (GZA). Sample Round No. 5 was carried out by the New Hampshire Department of Environmental Services (NHDES). Please refer to the analytical laboratory reports for additional information.
2. Concentration is in milligrams per liter (mg/L), which is equivalent to parts per million (ppm). Oxidation-reduction potential (ORP) is in millivolts (mV).
3. "<" indicates that the respective parameter was not detected above the associated analytical laboratory Reporting Limit (RL).
4. "OR" indicates that the respective parameter was out of range of the meter.
5. For the Chemical Oxygen Demand (COD)/Total Organic Carbon (TOC) table, where values for both parameters are available for a given sampling round, the COD value is provided first, followed by the TOC value (e.g., 520/180).
6. This table considers only those parameters that were analyzed for and detected. Please refer to current and past analytical laboratory reports for the complete list of analytes.
7. Baseline sampling rounds conducted from August 1987 through April 1997 prior to the start of the July 1997 bioremediation pilot test are not included on this table. Please refer to the 2009 Annual Summary Letter Report or earlier reports for analytical results during these early sampling rounds.
8. Wells which have not been sampled since 2007 or earlier are not included on this table. Please refer to past reports for analytical results for these wells.
9. "AGQS" refers to NHDES Ambient Groundwater Quality Standards (AGQS) included in Env-Or 603.03. "GW-2" refers to the Groundwater to Indoor Air Screening Levels included in Table 1 – Vapor intrusion Screening Levels of the Vapor Intrusion Guidance. "NA" indicates that the respective standard has not yet been established.
10. Values in **bold** were detected above the laboratory reporting limit; shading indicates exceedances of standards, or that the concentration was at the respective standard.
11. "NT" indicates respective parameter was not tested during the respective sample round. "NI" indicates the monitoring well was not yet installed on the respective date.
12. Dissolved oxygen and ORP analyses were performed in the field using parameter-specific electrodes.
13. Monitoring wells MW-1 through MW-8 were installed by Jacques Whitford Company, Inc. between January 14, 2002 and January 16, 2002.
14. Please note that methyl *tert*-butyl ether (M*t*BE) was detected, but below the RL limit in a groundwater sample collected from monitoring well GZ-1L during the November 1994 monitoring round. Note: The RCMP standard for M*t*BE is 0.013 ppm.
15. Ethane, Ethene, 1,4-Dichlorobenzene (1,4-DCB) and 1,2-Dichlorobenzene (1,2-DCB) were detected at well MW-1D during the June 2004 monitoring round at concentrations of 0.18 mg/L, 0.24 mg/L, 0.002 mg/L and 0.001 mg/L, respectively.
16. During the August 2007 sampling round, acetone was detected at wells GZ-201L and GZ-202L at concentrations of 1.0 mg/L and 0.35mg/L, respectively. GZA notes that acetone is frequently a lab-derived contaminant.
17. The August 2010 monitoring round sample for well GZ-303 was taken on March 31, 2010.
18. During the August 2011 sampling round, M*t*BE, Isopropylbenzene, n-propylbenzene, 1,3,5-trimethylbenzene (1,3,5-TMB), 1,2,4-trimethylbenzene (1,2,4-TMB), 1,4-DCB, and 1,2-DCB were detected in well MW-1D at concentrations of 0.015 mg/L, 0.0012 mg/L, 0.0016 mg/L, 0.0022 mg/L, 0.0074 mg/L, 0.0024 mg/L, and 0.0019 mg/L, respectively.
19. During the June 2012 sampling round, 1,2,4-TMB, 1,3,5-TMB, and 1,4-DCB were detected in well MW-1D at concentrations of 0.009 mg/L, 0.0027 mg/L, and 0.0026 mg/L, respectively. Chloroform was detected at GZ-203L at a concentration of 0.0035 mg/L.
20. During the August 2012 sampling round, 1,2,4-TMB, 1,3,5-TMB, 1,2-DCB, 1,4-DCB, n-propylbenzene, isopropylbenzene, and M*t*BE were detected in well MW-1D at concentrations of 0.0071 mg/L, 0.0019 mg/L, 0.0013 mg/L, 0.0021 mg/L, 0.0015 mg/L, 0.001 mg/L, and 0.0031 mg/L, respectively. Total Trihalomethanes, water treatment disinfection by-products, were detected at GZ-203L at a concentration of 0.006 mg/L.

TABLE 5A NOTES
NORTHERN SITE PORTION, LOWER UNIT

21. During the November 2012 sampling round, 1,2,4-TMB, 1,3,5-TMB, 1,2-DCB, 1,4-DCB, n-propylbenzene, and M*t*BE were detected in well MW-1D at concentrations of 0.0058 mg/L, 0.002 mg/L, 0.0014 mg/L, 0.002 mg/L, 0.0014 mg/L, and 0.005 mg/L, respectively.

22. During the August 2013 sampling round, 1,2,4-TMB (0.007 mg/L), 1,3,5-TMB (0.002 mg/L), 1,2-DCB (0.002 mg/L), 1,4-DCB (0.002 mg/L), isopropylbenzene (0.001 mg/L), **methyl-tert-butyl-ether** (**MtBE, 0.02 mg/L**), and n-propylbenzene (0.002 mg/L) were detected in well MW-1D. The NH AGQS for M*t*BE is 0.013 mg/L. Total trihalomethanes were detected at GZ-203L at a concentration of 0.004 mg/L during the August 2013 sampling round.

23. During the November 2013 sampling round 1,2,4-TMB (0.0062 mg/L), 1,3,5-TMB (0.0018 mg/L), 1,2-DCB (0.0011 mg/L), 1,4-DCB (0.0018 mg/L), isopropylbenzene (0.001 mg/L), and n-propylbenzene (0.0014 mg/L) were detected in well MW-1D. Total Trihalomethanes, water treatment disinfection by-products, were detected at GZ-203L at a concentration of 0.002 mg/L.

24. During the June 2014 sampling round 1,2,4-TMB (0.006 mg/L), 1,3,5-TMB (0.002 mg/L), 1,2-DCB (0.001 mg/L), 1,4-DCB (0.002 mg/L), and n-propylbenzene (0.001 mg/L) were detected in well MW-1D.

25. During the August 2014 sampling round 1,2,4-TMB (0.008 mg/L), 1,3,5-TMB (0.002 mg/L), 1,2-DCB (0.001 mg/L), 1,4-DCB (0.002 mg/L), MtBE (0.01 mg/L), naphthalene (0.001 mg/L), and n-propylbenzene (0.002 mg/L) were detected in well MW-1D. 1,1,2-trichloroethane (1,1,2-TCA, 0.001 mg/L) was detected in well GZ-9L.

26. During the November 2014 sampling round 1,2,4-TMB (0.005 mg/L), 1,3,5-TMB (0.002 mg/L), 1,4-DCB (0.002 mg/L), MtBE (0.009 mg/L), and n-propylbenzene (0.001 mg/L) were detected in well MW-1D.

27. During the June 2015 sampling round methyl tert-butyl ether (0.02 mg/L) was detected in well MW-1D.

TABLE 5B NOTES
SOUTHERN SITE PORTION, LOWER UNIT

Former Wastewater Treatment Facility
Salem, New Hampshire
NHDES #198405033

Notes:

1. Sample Round Nos. 1 through 4, 6, and subsequent rounds were carried out by GZA GeoEnvironmental, Inc. (GZA). Sample Round No. 5 was carried out by the New Hampshire Department of Environmental Services (NHDES). Please refer to the analytical laboratory reports for additional information.
2. Concentration is in milligrams per liter (mg/L), which is equivalent to parts per million (ppm). Oxidation-reduction potential (ORP) is in millivolts (mV).
3. "<" indicates that the respective parameter was not detected above the associated analytical laboratory Reporting Limit (RL).
4. "OR" indicates that the respective parameter was out of range of the meter.
5. For the Chemical Oxygen Demand (COD)/Total Organic Carbon (TOC) table, where values for both parameters are available for a given sampling round, the COD value is provided first, followed by the TOC value (e.g., 520/180).
6. This table considers only those parameters that were analyzed for and detected. Please refer to current and past analytical laboratory reports for the complete list of analytes.
7. Baseline sampling rounds conducted from August 1987 through April 1997 prior to the start of the July 1997 bioremediation pilot test are not included on this table. Please refer to the 2009 Annual Summary Letter Report or earlier reports for analytical results during these early sampling rounds.
8. Wells which have not been sampled since 2007 or earlier are not included on this table. Please refer to past reports for analytical results for these wells.
9. "AGQS" refers to NHDES Ambient Groundwater Quality Standards (AGQS) included in Env-Or 603.03. "GW-2" refers to the Groundwater to Indoor Air Screening Levels included in Table 1 – Vapor intrusion Screening Levels of the Vapor Intrusion Guidance. "NA" indicates that the respective standard has not yet been established.
10. Values in **bold** were detected above the laboratory reporting limit; shading indicates exceedances of standards, or that the concentration was at the respective standard.
11. "NT" indicates respective parameter was not tested during the respective sample round. "NI" indicates the monitoring well was not yet installed on the respective date.
12. Dissolved oxygen and ORP analyses were performed in the field using parameter-specific electrodes.
13. Monitoring wells MW-1 through MW-8 were installed by Jacques Whitford Company, Inc. between January 14, 2002 and January 16, 2002.
14. During the August 2007 sampling round, 1,2,4-Trimethylbenzene (1,2,4-TMB) was detected at well GZ-2L at a concentration of 0.0012 mg/L.
15. During the August 2008 sampling round, 1,2-Dichlorobenzene (1,2-DCB) and 1,4-Dichlorobenzene (1,4-DCB) were detected at well GZ-3L at concentrations of 0.0016mg/L and 0.001mg/L, respectively.
16. Chloromethane was detected at well GZ-3B on November 20, 2008 at a concentration of 0.0021 mg/L.
17. During the August 2010 sampling round, acetone and 2-butanone (MEK) were detected at well GZ-606L at concentrations of 0.07 m/L and 0.12 mg/L respectively. 1,2-DCB was detected at well GZ-3L at a concentration of 0.001 mg/L. 1,2,4-TMB was detected at well GZ-2L at a concentration of 0.003 mg/L.
18. During the November 2010 sampling round, 1,2,4-TMB was detected at wells GZ-405L, GZ-2L, at concentrations of 0.003 mg/L, 0.002 mg/L, respectively.
19. During the August 2011 sampling round, 1,2,4-TMB was detected at well GZ-405L at a concentration of 0.01 mg/L. Acetone, 2-butanone (MEK), and methyl isobutyl ketone (MIBK) were detected at well GZ-606L at concentrations of 0.026 mg/L, 0.023 mg/L, and 0.011 mg/L, respectively.
20. During the November/December 2011 sampling round, 1,2,4-TMB and 1,2-DCB were detected at well GZ-3L at concentrations of 0.0028 mg/L and 0.0035 mg/L, respectively. Dichlorodifluoromethane was detected at well GZ-8L at a concentration of 0.0021 mg/L.
21. Well GZ-405L was sampled for all GMP specified parameters on November 30, 2011 for the November/December 2011 sampling round. A confirmatory sample for VOCs and field parameters was collected on December 9, 2011. Both results are included on Round 69 separated by a slash.

TABLE 5B NOTES
SOUTHERN SITE PORTION, LOWER UNIT

22. During the August 2012 sampling round, 1,2,4-TMB was detected at wells GZ-3L, GZ-609L and GZ-405L at concentrations of 0.0023 mg/L, 0.0073 mg/L, 0.0101 mg/L, respectively. 1,3,5-Trimethylbenzene (1,3,5-TMB) was detected at wells GZ-609L and GZ-405L at concentrations of 0.0021 mg/L, and 0.0036 mg/L, respectively. 1,2-DCB was detected at GZ-3L at 0.0014 mg/L. 1,4-DCB was detected at wells GZ-3L and GZ-609L at concentrations of 0.001 mg/L and 0.0015 mg/L, respectively. N-Propylbenzene was detected at wells GZ-609L and GZ-405L at concentrations of 0.0017 mg/L and 0.0024 mg/L, respectively. N-butylbenzene was detected at well GZ-405L at a concentration of 0.0011 mg/L.

23. During the November 2012 sampling round, 1,2,4-TMB was detected at GZ-405L at a concentration of 0.0042 mg/L. 1,3,5-TMB was detected at GZ-405L at a concentration of 0.0016 mg/L. 1,2-DCB was detected at GZ-3L at a concentration of 0.0012 mg/L. N-Propylbenzene was detected at GZ-405L at a concentration of 0.001 mg/L.

24. During the August 2013 sampling round, 1,2-DCB (0.001 mg/L) and 1,4-DCB (0.001 mg/L) were detected at well GZ-3L. 1,2,4-TMB (0.004 mg/L), 1,3,5-TMB (0.002 mg/L), carbon disulfide (0.009 mg/L), and n-propylbenzene (0.001 mg/L) were detected at well GZ-405L. Carbon disulfide was detected at well GZ-504L at a concentration of 0.001 mg/L. 1,2,4-TMB and 1,3,5-TMB were detected at well GZ-609L at concentrations of 0.003 mg/L and 0.001 mg/L. Carbon disulfide was detected in well GZ-610L at a concentration of 0.002 mg/L.

25. During the November 2013 sampling round, carbon disulfide was detected at well GZ-3L at a concentration of 0.0067 mg/L. 1,2,4-TMB (0.0033mg/L), 1,3,5-TMB (0.0014 mg/L), and carbon disulfide (0.0134 mg/L) were detected at well GZ-405L.

26. During the June 2014 sampling round, 1,2-DCB (0.002 mg/L) and 1,4-DCB (0.001 mg/L) were detected at well GZ-3L. 1,2,4-TMB (0.01 mg/L), 1,3,5-TMB (0.005 mg/L), carbon disulfide (0.01 mg/L), isopropylbenzene (0.001 mg/L), naphthalene (0.001 mg/L), and n-propylbenzene (0.002 mg/L) were detected at well GZ-405L. 1,2,4-TMB (0.006 mg/L), 1,3,5-TMB (0.002 mg/L), 1,4-DCB (0.002 mg/L), isopropylbenzene (0.001 mg/L), naphthalene (0.001 mg/L), and n-propylbenzene (0.002 mg/L) were detected at well GZ-609L.

27. During the August 2014 sampling round, 1,2-DCB (0.001 mg/L) was detected at well GZ-3L. 1,2,4-TMB (0.01 mg/L), 1,3,5-TMB (0.004 mg/L), isopropylbenzene (0.001 mg/L), naphthalene (0.001 mg/L), and n-propylbenzene (0.003 mg/L) were detected at well GZ-405L. 1,2,4-TMB (0.001 mg/L) was detected at well GZ-606L. 1,2,4-TMB (0.004 mg/L) and 1,3,5-TMB (0.001 mg/L), were detected at well GZ-609L.

28. During the November 2014 sampling round 1,2,4-TMB (0.006 mg/L), 1,3,5-TMB (0.002 mg/L), 1,4-DCB (0.001 mg/L), naphthalene (0.001 mg/L), and n-propylbenzene (0.001 mg/L) were detected at well GZ-2L. Carbon disulfide (0.06 mg/L) was detected at well GZ-3B. 1,2,4-TMB (0.002 mg/L) was detected at well GZ-606L. 1,2,4-TMB (0.005 mg/L), 1,3,5-TMB (0.002 mg/L), and n-propylbenzene (0.001 mg/L) were detected at well GZ-609L. Ethyl tertiary-butyl ether (0.003 mg/L) was detected at well GZ-701L.

29. During the June 2015 sampling round 1,2-dichlorobenzene (0.001 mg/L) was detected in well GZ-3L. 1,2,4-trimethylbenzene (0.001 mg/L) was detected in GZ-606L. 1,2,4-trimethylbenzene (0.009 mg/L), 1,3,5-trimethylbenzene (0.003 mg/L), 1,4-dichlorobenzene (0.001 mg/L), isopropylbenzene (0.001 mg/L), naphthalene (0.001 mg/L), and n-propylbenzene (0.002 mg/l) were detected in GZ-609L.

TABLE 5C NOTES
NORTHERN SITE PORTION, UPPER UNIT

Former Wastewater Treatment Facility
Salem, New Hampshire
NHDES #198405033

Notes:

1. Sample Round Nos. 1 through 4, 6, and subsequent rounds were carried out by GZA GeoEnvironmental, Inc. (GZA). Sample Round No. 5 was carried out by the New Hampshire Department of Environmental Services (NHDES). Please refer to the analytical laboratory reports for additional information.
2. Concentration is in milligrams per liter (mg/L), which is equivalent to parts per million (ppm). Oxidation-reduction potential (ORP) is in millivolts (mV).
3. "<" indicates that the respective parameter was not detected above the associated analytical laboratory Reporting Limit (RL).
4. "OR" indicates that the respective parameter was out of range of the meter.
5. For the Chemical Oxygen Demand (COD)/Total Organic Carbon (TOC) table, where values for both parameters are available for a given sampling round, the COD value is provided first, followed by the TOC value (e.g., 520/180).
6. This table considers only those parameters that were analyzed for and detected. Please refer to current and past analytical laboratory reports for the complete list of analytes.
7. Baseline sampling rounds conducted from August 1987 through April 1997 prior to the start of the July 1997 bioremediation pilot test are not included on this table. Please refer to the 2009 Annual Summary Letter Report or earlier reports for analytical results during these early sampling rounds.
8. Wells which have not been sampled since 2007 or earlier are not included on this table. Please refer to past reports for analytical results for these wells.
9. "AGQS" refers to NHDES Ambient Groundwater Quality Standards included in Env-Or 603.03. "WQCTS" indicates Water Quality Criteria for Toxic Substances included in Env-Wq 1703.21. The more stringent of the two regulations (AGQS or SWQC) was used for surface water samples. "GW-2" refers to the Groundwater to Indoor Air Screening Levels included in Table 1 – Vapor intrusion Screening Levels of the Vapor Intrusion Guidance. "NA" indicates that the respective standard has not yet been established.
10. Values in **bold** were detected above the laboratory reporting limit; shading indicates exceedances of standards, or that the concentration was at the respective standard.
11. "NT" indicates respective parameter was not tested during the respective sample round. "NI" indicates the monitoring well was not yet installed on the respective date.
12. Dissolved oxygen and ORP analyses were performed in the field using parameter-specific electrodes.
13. Monitoring wells MW-1 through MW-8 were installed by Jacques Whitford Company, Inc. between January 14, 2002 and January 16, 2002.
14. During the June 2015 sampling round 1,1,1,2-tetrachloroethane (0.001 mg/L), 1,1,2-trichloroethane (0.003 mg/L), 1,2,4-trimethylbenzene (0.02 mg/L), 1,3,5-trimethylbenzenen (0.006 mg/L), 1,4-dichlorobenzene (0.002 mg/L), isopropylbenzene (0.003 mg/L), naphthalene (0.003mg/L), n-butylbenzene (0.001 mg/L), n-propylbenzene (0.004 mg/L). and sec-butylbenzene (0.001 mg/L) were detected in well GZ-616U

TABLE 5D NOTES
SOUTHERN SITE PORTION, UPPER UNIT

Former Wastewater Treatment Facility
Salem, New Hampshire
NHDES #198405033

Notes:

1. Sample Round Nos. 1 through 4, 6, and subsequent rounds were carried out by GZA GeoEnvironmental, Inc. (GZA). Sample Round No. 5 was carried out by the New Hampshire Department of Environmental Services (NHDES). Please refer to the analytical laboratory reports for additional information.
2. Concentration is in milligrams per liter (mg/L), which is equivalent to parts per million (ppm). Oxidation-reduction potential (ORP) is in millivolts (mV).
3. "<" indicates that the respective parameter was not detected above the associated analytical laboratory Reporting Limit (RL).
4. "OR" indicates that the respective parameter was out of range of the meter.
5. For the Chemical Oxygen Demand (COD)/Total Organic Carbon (TOC) table, where values for both parameters are available for a given sampling round, the COD value is provided first, followed by the TOC value (e.g., 520/180).
6. This table considers only those parameters that were analyzed for and detected. Please refer to current and past analytical laboratory reports for the complete list of analytes.
7. Baseline sampling rounds conducted from August 1987 through April 1997 prior to the start of the July 1997 bioremediation pilot test are not included on this table. Please refer to the 2009 Annual Summary Letter Report or earlier reports for analytical results during these early sampling rounds.
8. Wells which have not been sampled in the past six years (since 2007) are not included on this table. Please refer to past reports for analytical results for these wells.
9. "AGQS" refers to NHDES Ambient Groundwater Quality Standards (AGQS) included in Env-Or 603.03. "WQCTS" indicates Water Quality Criteria for Toxic Substances included in Env-Wq 1703.21. The more stringent of the two regulations (AGQS or SWQC) was used for surface water samples. "GW-2" refers to the Groundwater to Indoor Air Screening Levels included in Table 1 – Vapor intrusion Screening Levels of the Vapor Intrusion Guidance. "NA" indicates that the respective standard has not yet been established.
10. Values in **bold** were detected above the laboratory reporting limit; shading indicates exceedances of standards, or that the concentration was at the respective standard.
11. "NT" indicates respective parameter was not tested during the respective sample round. "NI" indicates the monitoring well was not yet installed on the respective date.
12. Dissolved oxygen and ORP analyses were performed in the field using parameter-specific electrodes.
13. Monitoring wells MW-1 through MW-8 were installed by Jacques Whitford Company, Inc. between January 14, 2002 and January 16, 2002.
14. 1,4-dichlorobenzene (1,4-DCB) and 1,2-dichlorobenzene (1,2-DCB) were detected at concentrations of 0.0021 and 0.0053 ppm, respectively, in monitoring well GZ-3A during August 1995 sampling round. Note: The RCMP standard for 1,4-DCB and 1,2-DCB is 0.075 and 0.6 ppm, respectively.
15. Please note that methyl *tert*-butyl ether (M*t*BE) was detected, but below the RL limit in a groundwater sample collected from surface water sampling location SW-6 at a concentration of 0.0068 ppm during May 1996 sampling round. Note: The RCMP standard for M*t*BE is 0.013 ppm.
16. During the December 2005 sampling round, chlorobenzene, 1,3-dichlorobenzene (1,3-DCB), 1,4-DCB, and 1,2-DCB were detected at well GZ-408 at concentrations of 0.0065 mg/L, 0.0051 mg/L, 0.023 mg/L, and 0.0025 mg/L, respectively.
17. During the August 2007 sampling round, 1,2-DCB was detected in well GZ-3A at a concentration of 0.0053 mg/L. 1,1,2-Trichloroethene was detected in wells GZ-601U and GZ-606U at concentrations of 0.069 mg/L and 0.085 mg/L, respectively.
18. During the August 2010 sampling round, acetone and 2-butanone (MEK) were detected at well GZ-3A at a concentration of 0.6 mg/L and 0.3 mg/L, respectively. 1,2-DCB was detected at well GZ-618U at a concentration of 0.02 mg/L.
19. During the November 2010 sampling round, acetone was detected at well GZ-3A and surface water location SW-6 at concentrations of 0.2 mg/L and 0.02 mg/L, respectively. 1,2,4-trimethylbenzene (1,2,4-TMB) was detected at wells GZ-618U, GZ-2, and GZ-3A at concentrations of 0.002 mg/L, 0.007 mg/L, and 0.010 mg/L, respectively. 1,2-DCB was detected at wells GZ-618U and GZ-3A at concentrations of 0.035 mg/L and

0.01 mg/L, respectively. MEK was detected at well GZ-3A at a concentration of 0.2 mg/L. Chlorobenzene, 1,3-dichlorobenzene, and 1,4-dichlorobenzene were detected at well GZ-618U at concentrations of 0.003 mg/L, 0.003 mg/L, and 0.015 mg/L, respectively.

20. During the August 2011 sampling round, n-propylbenzene, 1,3,5-trimethylbenzene (1,3,5-TMB), 1,2,4-TMB, and 1,4-DCB were detected at well GZ-2 at concentrations of 0.0011 mg/L, 0.002 mg/L, 0.0063 mg/L, and 0.001 mg/L, respectively. Acetone, MEK, 1,2,4-TMB, and 1,2-DCB were detected at well GZ-3A at concentrations of 0.18 mg/L, 0.19 mg/L, 0.0046 mg/L, and 0.0032 mg/L, respectively. Chlorobenzene, 1,2,4-TMB, 1,3-DCB, 1,4-DCB, and 1,2-DCB were detected at well GZ-618U at concentrations of 0.0027 mg/L, 0.0016 mg/L, 0.0017 mg/L, 0.01 mg/L, and 0.021 mg/L, respectively. Acetone was detected at surface water location SW-6 at a concentration of 0.012 mg/L.

21. During the November/December 2011 sampling round, 1,2,4-TMB, chlorobenzene, 1,3-DCB, 1,4-DCB, and 1,2-DCB were detected at well GZ-618U at concentrations of 0.0018 mg/L, 0.0039 mg/L, 0.0018 mg/L, 0.010 mg/L, and 0.022 mg/L, respectively.

22. During the August 2012 sample round, 1,2,4-TMB was detected at wells GZ-3A, GZ-612U, GZ-2, and GZ-618U at concentrations of 0.0037 mg/L, 0.0012 mg/L, 0.0080 mg/L, and 0.0022 mg/L, respectively. 1,3,5-TMB was detected at well GZ-2 at a concentration of 0.0025 mg/L. 1,2-DCB was detected at wells GZ-3A, GZ-612U, GZ-618U at concentrations of 0.0024 mg/L, 0.0074 mg/L, and 0.0206 mg/L, respectively. 1,4-DCB was detected at wells GZ-3A, GZ-2, GZ-612U, GZ-618U at concentrations of 0.0013 mg/L, 0.0011 mg/L, 0.0079 mg/L, and 0.0107 mg/L, respectively. N-propylbenzene was detected at well GZ-2 at a concentration of 0.0015 mg/L. 1,3-DCB and carbon disulfide were detected at wells GZ-612U and GZ-618U at concentrations of 0.0024 mg/L and 0.0019 mg/L, and 0.0068 mg/L and 0.011 mg/L, respectively. Chlorobenzene was detected at wells GZ-612U, GZ-3A, GZ-618U at concentrations of 0.0032 mg/L, 0.0011 mg/L, and 0.0038 mg/L, respectively. Naphthalene was detected at wells GZ-2, GZ-3A, and GZ-612U at 0.001 mg/L, 0.0015 mg/L, and 0.0011 mg/L, respectively. Carbon Tetrachloride was detected at well GZ-405U at a concentration of 0.0022 mg/L.

23. During the November 2012 sample round, 1,2,4-TMB (0.0163 mg/L) was detected at well GZ-2. 1,2-DCB (0.0139 mg/L) was detected at well GZ-618U. 1,4-DCB (0.0047 mg/L) was detected at well GZ-618U. Chlorobenzene (0.0022 mg/L) was detected at well GZ-618U. Total Trihalomethanes were detected at well GZ-618U at a total concentration of 1.4 mg/L. Dibromochloromethane was detected at GZ-618U at a concentration of 0.0014 mg/L.

24. During the August 2013 sampling round, 1,2,4-TMB (0.008 mg/L), 1,3,5-TMB (0.003 mg/L), 1,4-DCB (0.001 mg/L), and n-propylbenzene (0.001 mg/L) were detected at well GZ-2. Chloromethane was detected at wells GZ-403U, GZ-404U, and GZ-618U at a concentration of 0.002 mg/L each. 1,2,4-TMB (0.003 mg/L), 1,2-DCB (0.02 mg/L), 1,3-DCB (0.002 mg/L), 1,4-DCB (0.01 mg/L), carbon disulfide (0.003 mg/L), chlorobenzene (0.006 mg/L), chloromethane (0.002 mg/L), and naphthalene (0.001 mg/L) were detected at well GZ-618U.

25. During the November 2013 sampling round, 1,2,4-TMB (0.0039 mg/L) and 1,3,5-TMB (0.0012 mg/L) were detected at well GZ-2.

26. During the June 2014 sampling round, 1,2,4-TMB was detected at wells GZ-2 (0.001 mg/L) and GZ-802UD (0.3 mg/L). 1,2-DCB (0.02 mg/L), 1,3-DCB (0.002 mg/L), 1,4-DCB (0.009 mg/L), and chlorobenzene (0.005 mg/L) were detected at well GZ-618U.

27. During the August 2014 sampling round, 1,2,4-TMB (0.005 mg/L), 1,3,5-TMB (0.002 mg/L), and n-propylbenzene (0.001 mg/L) were detected at GZ-2. 1,2-DCB (0.02 mg/L) and 1,4-DCB (0.01 mg/L) were detected at well GZ-618U.

28. During the November 2014 sampling round, 1,2-DCB (0.02 mg/L) and 1,4-DCB (0.01 mg/L) were detected at well GZ-618U. Carbon disulfide (0.002 mg/L) was detected at well GZ-701U. 1,2,4-TMB was detected at wells GZ-802UD (0.1 mg/L) and GZ-803U (0.1 mg/L).

29. During the June 2015 sampling round 1,2,4-trimethylbenzene (0.006 mg/L), 1,2-dichlorobenzene (0.004 mg/L), 1,3,5-trimethylbenzene (0.002 mg/L), 1,4-dichlorobenzene (0.003 mg/L), carbon disulfide (0.01 mg/L), chlorobenzene (0.001 mg/L), naphthalene (0.005 mg/L), and n-propylbenzene (0.001 mg/L) were detected in GZ-3A. 1,2,4-trimethylbenzene (0.003 mg/L), 1,2-dichlorobenzene (0.02 mg/L), 1,3-dichlorobenzene (0.002), 1,4-dichlorobenzene (0.008 mg/L), chlorobenzene (0.005 mg/L) and naphthalene (0.001 mg/L) were detected in well GZ-618U. Methyl tert-butyl ether (0.02 mg/L) was detected in well MW-1D.

NOTE: Please refer to last page for table notes.

Former Wastewater Treatment Facility
Salem, New Hampshire
NHDES #198405033

Notes:

1. Sample Rounds were performed by GZA GeoEnvironmental, Inc. (GZA). Please refer to the analytical laboratory reports for additional information.
2. Concentration is in micrograms per liter (µg/L), which is equivalent to parts per billion (ppb). Oxidation-reduction potential (ORP) is in millivolts (mV).
3. "<" indicates that the respective parameter was not detected above the associated analytical laboratory Reporting Limit (RL). "ND" indicates that the respective parameter was not detected above the RL, but that the RL is not readily available.
4. "OR" indicates that the respective parameter was out of range of the meter.
5. This table considers only those parameters that were analyzed for and detected. Please refer to current and past analytical laboratory reports for the complete list of analytes.
6. This table does not contain data from sampling events prior to 2010 or from wells that are not currently included on the Groundwater Management Permit (No. GWP198405033-S-005). Refer to the attached historic analytical table for analytical data prior to 2010 and additional tables for supplemental sampling locations, if any.
7. "AGQS" refers to NHDES Ambient Groundwater Quality Standards included in Env-Or 603.03. "WQCTS" indicates Water Quality Criteria for Toxic Substances included in Env-Wq 1703.21. The more stringent of the two regulations (AGQS or WQCTS) was used for surface water samples. "GW-2" refers to the Groundwater to Indoor Air Screening Levels included in Table 1 – Vapor intrusion Screening Levels of the Vapor Intrusion Guidance. "NA" indicates that the respective standard has not yet been established.
8. Values in **bold** were detected above the laboratory reporting limit; shading indicates exceedances of standards, or that the concentration was at the respective standard; italics indicates exceedances of GW-2 screening standards.
9. "NT" indicates respective parameter was not tested during the respective sample round.
10. "E" indicates laboratory estimated value reported above the quantitation limit.
11. Dissolved oxygen and ORP analyses were performed in the field using parameter-specific electrodes.
12. Monitoring wells MW-1S through MW-8 were installed by Jacques Whitford Company, Inc. between January 14, 2002 and January 16, 2002.
13. During the August 2012 sample round, carbon tetrachloride (2.2 µg/L) was detected at well GZ-405U.
14. During the August 2013 sampling round, chloromethane was detected at wells GZ-403U (2 µg/L) and GZ-404U (2 µg/L).
15. Styrene was detected in wells GZ-405U (1 µg/L) and GZ-607U (2 µg/L).
16. During the June 2016 sampling round, 1,1,1,2-tetrachloroethane (2 µg/L), 4-isopropyltolune (2 µg/L), carbon tetrachloride (**20** µg/L), isopropylbenzene (4 µg/L), n-Butylbenzene (3µg/L), sec-Butylbenzene (2 µg/L), and styrene (1 µg/L) were detected in well GZ-405U. 1,1,1,2-tetrachloroethane (7 µg/L), 1,1,2-trichloroethane (**10** µg/L), Carbon tetrachloride (**30** µg/L), isopropylbenzene (2 µg/L), and styrene (2 µg/L) were detected in well GZ-607U. Isopropylbenzene (5 µg/L), n-Butylbenzene (2 µg/L), and sec-Butylbenzene (3 µg/L) were detected in well GZ-802-US.
17. During the November 2016 sampling round, isopropylbenzene (1 µg/L) was detected in well GZ-3A. 1,1,1,2-tetrachloroethane (10 µg/L), 1,1,2-trichloroethane (**30** µg/L), carbon tetrachloride (**40** µg/L), isopropylbenzene (2 µg/L), styrene (2 µg/L), and total trihalomethanes (0.01 mg/L) were detected in well GZ-607U. 1,1,2-trichloroethane (1 µg/L) was detected in well GZ-609U.

NOTE: Please refer to last page for table notes.

Former Wastewater Treatment Facility
Salem, New Hampshire
NHDES #198405033

Notes:

1. Sample Rounds were performed by GZA GeoEnvironmental, Inc. (GZA). Please refer to the analytical laboratory reports for additional information.
2. Concentration is in micrograms per liter (µg/L), which is equivalent to parts per billion (ppb). Oxidation-reduction potential (ORP) is in millivolts (mV).
3. "<" indicates that the respective parameter was not detected above the associated analytical laboratory Reporting Limit (RL). "ND" indicates that the respective parameter was not detected above the RL, but that the RL is not readily available.
4. "OR" indicates that the respective parameter was out of range of the meter.
5. This table considers only those parameters that were analyzed for and detected. Please refer to current and past analytical laboratory reports for the complete list of analytes.
6. This table does not contain data from sampling events prior to 2010 or from wells that are not currently included on the Groundwater Management Permit (No. GWP198405033-S-005). Refer to the attached historic analytical table for analytical data prior to 2010 and additional tables for supplemental sampling locations, if any.
7. "AGQS" refers to NHDES Ambient Groundwater Quality Standards (AGQS) included in Env-Or 603.03. "GW-2" refers to the Groundwater to Indoor Air Screening Levels included in Table 1 – Vapor intrusion Screening Levels of the Vapor Intrusion Guidance. "NA" indicates that the respective standard has not yet been established.
8. Values in **bold** were detected above the laboratory reporting limit; shading indicates exceedances of AGQS, or that the concentration was at the respective AGQS; italics indicates exceedances of GW-2 screening standards.
9. "NT" indicates respective parameter was not tested during the respective sample round.
10. "E" indicates laboratory estimated value reported above the quantitation limit.
11. Dissolved oxygen and ORP analyses were performed in the field using parameter-specific electrodes.
12. Monitoring well MW-1D was installed by Jacques Whitford Company, Inc. during January 2002.
13. The August 2010 monitoring round sample for well GZ-303 was taken on March 31, 2010.
14. Well GZ-405L was sampled for all GMP specified parameters on November 30, 2011 for the November/December 2011 sampling round. A confirmatory sample for VOCs and field parameters was collected on December 9, 2011. Both results are included on Round 69 separated by a slash.
15. During the August 2012 sampling round, n-butylbenzene (1.1 µg/L) was detected at well GZ-405L.
16. During the August 2014 sampling round, 1,1,2-trichloroethane (1,1,2-TCA, 1 µg/L) was detected in well GZ-9L.
17. During the November 2014 sampling round, ethyl tertiary-butyl ether (3 µg/L) was detected at well GZ-701L. N-Butylbenzene (4 µg/L) and sec-Butylbenzene (3 µg/L) were detected in well GZ-505LR (4µg/L).
18. During the June 2016 sampling round, 4-Isopropyltoluene (3 µg/L), n-butylbenzene (4 µg/L), and sec-butylbenzene (3 µg/L) were detected at well GZ-505LR.
19. During the November 2016 sampling round, ethyl tertiary-butyl ether (2.0 µg/L) was detected at well GZ-701L. 1,1,2-TCA (1 µg/L) was detected in well GZ-201L.

TABLE 1C
WATER QUALITY SUMMARY TABLE - 2015 RESULTS FOR FORMER GMP-RELATED WELLS
Former Wastewater Treatment Facility
Salem, New Hampshire
NHDES #198405033

Contaminant:		**Total Organic Carbon (TOC), Sample Round No. 13,**						**Shallow Wells**		**Total Organic Carbon (TOC), Sample Round No. 13,**						**Deep Wells**		
		Chemical Oxygen Demand (COD), Subsequent Sample Rounds until Round No. 43. Data for that round respectively reflect COD and TOC concentrations.								**Chemical Oxygen Demand (COD), Subsequent Sample Rounds until Round No. 43. Data for that round respectively reflect COD and TOC concentrations.**

TABLE 2
WATER QUALITY SUMMARY TABLE

Site Name: Former Wastewater Treatment Facility — Groundwater Management Permit #: GWP-840533-S-002
Site Town: Salem, New Hampshire — (DES #: 840533)

Notes:

1. Sample Round Nos. 1 through 4, 6, and subsequent rounds were carried out by GZA GeoEnvironmental, Inc. (GZA) or Eastern Analytical, Inc. (EAI) on the dates indicated. Sample Round No. 5 was carried out by the New Hampshire Department of Environmental Services (NHDES) on the date indicated. Please refer to the analytical laboratory reports for additional information.
2. Concentration is in milligrams per liter (mg/L), which is equivalent to parts per million (ppm). Oxidation-reduction potential (ORP) is in millivolts (mV).
3. "<" indicates that the respective parameter was not detected above the reported practical quantification limit (PQL).
4. "≤" indicates that the respective parameter was detected, but below the reported PQL. "ND" indicates that the respective parameter was not detected above the PQL. "OR" indicates that the respective parameter was of range of the meter.
5. For the Chemical Oxygen Demand (COD)/Total Organic Carbon (TOC) table, where values for both parameters are available for a given sampling round, the COD value is provided first, followed by the TOC value (e.g., 520/180).
6. This table considers only those parameters that were analyzed for and detected. Please refer to current and past analytical laboratory reports for the complete list of analytes.
7. "RCMP" refers to NHDES Risk Characterization and Management Policy groundwater quality standards. The designations GW-1 and GW-2 are from the Method 1 Groundwater Standards. The more stringent value for either GW-1 or GW-2 was used as the standard. "SWQR" indicates Surface Water Quality Regulations. The more stringent of the two regulations (RCMP or SWQR) was used for surface water samples. "NA" indicates not available for respective parameter. Values in **bold** reflect exceedances of standards, or that the concentration was at the respective standard.
8. "NT" indicates respective parameter was not tested during the respective sample round. For the case of GZ-10L during Sample Round No. 7 and subsequent rounds, the reason was the destruction of this monitoring well. GZA attempted, but was unable to repair and sample this well during the July 1994 round, and then established monitoring well GZ-2L as a replacement sampling location. "NI" indicates monitoring well not installed on respective date.
9. Please note that methyl *tert*-butyl ether (M*t*BE) was detected, but below the PQL limit in a groundwater sample collected from monitoring well GZ-1L during Sample Round No. 9 and in a sample collected from surface water sampling location SW-6 at a concentration of 0.0068 ppm during Sample Round No. 13. Note: The RCMP standard for M*t*BE is 0.013 ppm. 1,4-dichlorobenzene (1,4-DCB) and 1,2-dichlorobenzene (1,2-DCB) were detected at concentrations of 0.0021 and 0.0053 ppm, respectively, in monitoring well GZ-3A during Sample Round No. 11. Note: The RCMP standard for 1,4-DCB and 1,2-DCB is 0.075 and 0.6 ppm, respectively.
10. Dissolved oxygen and ORP analysis were performed in the field using parameter-specific electrodes.
11. Monitoring wells MW-1 through MW-8 were installed by Jacques Whitford Company, Inc. between January 14, 2002 and January 16, 2002.
12. Ethane, Ethene, 1,4-Dichlorobenzene and 1,2-Dichlorobenzene were detected at MW-1D during the June 2004 monitoring round at concentrations of 0.18 mg/L, 0.24 mg/L, 0.002 mg/L and 0.001 mg/L, respectively.
13. Chlorobenzene, 1,3-Dichlorobenzene, 1,4-Dichlorobenzene, and 1,2-Dichlorobenzene were detected at GZ-408 during the December monitoring round at concentrations of 0.0065 mg/L, 0.0051 mg/L, 0.023 mg/L, and 0.0025 mg/L respectively.
14. 1,2 Dichlorobenzene was detected in GZ-3A during the 8/7/2007 sampling round at a concentration of 0.0053 mg/L.
15. 1,1,2 Trichloroethene was detected during the 8/22/2007 sampling round in GZ-601U and GZ-606U at concentrations of 0.069 mg/L and 0.085 mg/L respectively.

TABLE 2B

TABLE 2
WATER QUALITY SUMMARY TABLE

Site Name: Former Wastewater Treatment Facility — Groundwater Management Permit #: GWP-840533-S-002
Site Town: Salem, New Hampshire — (DES #: 840533)

Notes:

1. Sample Round Nos. 1 through 4, 6, and subsequent rounds were carried out by GZA GeoEnvironmental, Inc. (GZA) or Eastern Analytical, Inc. (EAI) on the dates indicated. Sample Round No. 5 was carried out by the New Hampshire Department of Environmental Services (NHDES) on the date indicated. Please refer to the analytical laboratory reports for additional information.
2. Concentration is in milligrams per liter (mg/L), which is equivalent to parts per million (ppm). Oxidation-reduction potential (ORP) is in millivolts (mV).
3. "<" indicates that the respective parameter was not detected above the reported practical quantification limit (PQL).
4. "≤" indicates that the respective parameter was detected, but below the reported PQL. "ND" indicates that the respective parameter was not detected above the PQL. "OR" indicates that the respective parameter was of range of the meter.
5. For the Chemical Oxygen Demand (COD)/Total Organic Carbon (TOC) table, where values for both parameters are available for a given sampling round, the COD value is provided first, followed by the TOC value (e.g., 520/180).
6. This table considers only those parameters that were analyzed for and detected. Please refer to current and past analytical laboratory reports for the complete list of analytes.
7. "RCMP" refers to NHDES Risk Characterization and Management Policy groundwater quality standards. The designations GW-1 and GW-2 are from the Method 1 Groundwater Standards. The more stringent value for either GW-1 or GW-2 was used as the standard. "SWQR" indicates Surface Water Quality Regulations. The more stringent of the two regulations (RCMP or SWQR) was used for surface water samples. "NA" indicates not available for respective parameter. Values in **bold** reflect exceedances of standards, or that the concentration was at the respective standard.
8. "NT" indicates respective parameter was not tested during the respective sample round. For the case of GZ-10L during Sample Round No. 7 and subsequent rounds, the reason was the destruction of this monitoring well. GZA attempted, but was unable to repair and sample this well during the July 1994 round, and then established monitoring well GZ-2L as a replacement sampling location. "NI" indicates monitoring well not installed on respective date.
9. Please note that methyl *tert*-butyl ether (M*t*BE) was detected, but below the PQL limit in a groundwater sample collected from monitoring well GZ-1L during Sample Round No. 9 and in a sample collected from surface water sampling location SW-6 at a concentration of 0.0068 ppm during Sample Round No. 13. Note: The RCMP standard for M*t*BE is 0.013 ppm. 1,4-dichlorobenzene (1,4-DCB) and 1,2-dichlorobenzene (1,2-DCB) were detected at concentrations of 0.0021 and 0.0053 ppm, respectively, in monitoring well GZ-3A during Sample Round No. 11. Note: The RCMP standard for 1,4-DCB and 1,2-DCB is 0.075 and 0.6 ppm, respectively.
10. Dissolved oxygen and ORP analysis were performed in the field using parameter-specific electrodes.
11. Monitoring wells MW-1 through MW-8 were installed by Jacques Whitford Company, Inc. between January 14, 2002 and January 16, 2002.
12. Ethane, Ethene, 1,4-Dichlorobenzene and 1,2-Dichlorobenzene were detected at MW-1D during the June 2004 monitoring round at concentrations of 0.18 mg/L, 0.24 mg/L, 0.002 mg/L and 0.001 mg/L, respectively.
13. Chlorobenzene, 1,3-Dichlorobenzene, 1,4-Dichlorobenzene, and 1,2-Dichlorobenzene were detected at GZ-408 during the December monitoring round at concentrations of 0.0065 mg/L, 0.0051 mg/L, 0.023 mg/L, and 0.0025 mg/L respectively.
14. 1,2 Dichlorobenzene was detected in GZ-3A during the 8/7/2007 sampling round at a concentration of 0.0053 mg/L.
15. 1,1,2 Trichloroethene was detected during the 8/22/2007 sampling round in GZ-601U and GZ-606U at concentrations of 0.069 mg/L and 0.085 mg/L respectively.

TABLE 2C
WATER QUALITY SUMMARY TABLE - NORTHERN SITE PORTION, UPPER UNIT

Site Name: Former Wastewater Treatment Facility
Site Town: Salem, New Hampshire

Groundwater Management Permit #: GWP-840533-5-002
(DES #: 840533)

Contaminant: **Total Organic Carbon (TOC), Sample Round No. 13,**

Chemical Oxygen Demand (COD), Subsequent Sample Rounds until Round No. 43. Data for that round respectively reflect COD and TOC concentrations.

	Round Number	Sample Date	Groundwater RCMP = NA

TABLE 2
WATER QUALITY SUMMARY TABLE

Site Name: Former Wastewater Treatment Facility — Groundwater Management Permit #: GWP-840533-S-002
Site Town: Salem, New Hampshire — (DES #: 840533)

Notes:

1. Sample Round Nos. 1 through 4, 6, and subsequent rounds were carried out by GZA GeoEnvironmental, Inc. (GZA) or Eastern Analytical, Inc. (EAI) on the dates indicated. Sample Round No. 5 was carried out by the New Hampshire Department of Environmental Services (NHDES) on the date indicated. Please refer to the analytical laboratory reports for additional information.
2. Concentration is in milligrams per liter (mg/L), which is equivalent to parts per million (ppm). Oxidation-reduction potential (ORP) is in millivolts (mV).
3. "<" indicates that the respective parameter was not detected above the reported practical quantification limit (PQL).
4. "≤" indicates that the respective parameter was detected, but below the reported PQL. "ND" indicates that the respective parameter was not detected above the PQL. "OR" indicates that the respective parameter was of range of the meter.
5. For the Chemical Oxygen Demand (COD)/Total Organic Carbon (TOC) table, where values for both parameters are available for a given sampling round, the COD value is provided first, followed by the TOC value (e.g., 520/180).
6. This table considers only those parameters that were analyzed for and detected. Please refer to current and past analytical laboratory reports for the complete list of analytes.
7. "RCMP" refers to NHDES Risk Characterization and Management Policy groundwater quality standards. The designations GW-1 and GW-2 are from the Method 1 Groundwater Standards. The more stringent value for either GW-1 or GW-2 was used as the standard. "SWQR" indicates Surface Water Quality Regulations. The more stringent of the two regulations (RCMP or SWQR) was used for surface water samples. "NA" indicates not available for respective parameter. Values in **bold** reflect exceedances of standards, or that the concentration was at the respective standard.
8. "NT" indicates respective parameter was not tested during the respective sample round. For the case of GZ-10L during Sample Round No. 7 and subsequent rounds, the reason was the destruction of this monitoring well. GZA attempted, but was unable to repair and sample this well during the July 1994 round, and then established monitoring well GZ-2L as a replacement sampling location. "NI" indicates monitoring well not installed on respective date.
9. Please note that methyl *tert*-butyl ether (M*t*BE) was detected, but below the PQL limit in a groundwater sample collected from monitoring well GZ-1L during Sample Round No. 9 and in a sample collected from surface water sampling location SW-6 at a concentration of 0.0068 ppm during Sample Round No. 13. Note: The RCMP standard for M*t*BE is 0.013 ppm. 1,4-dichlorobenzene (1,4-DCB) and 1,2-dichlorobenzene (1,2-DCB) were detected at concentrations of 0.0021 and 0.0053 ppm, respectively, in monitoring well GZ-3A during Sample Round No. 11. Note: The RCMP standard for 1,4-DCB and 1,2-DCB is 0.075 and 0.6 ppm, respectively.
10. Dissolved oxygen and ORP analysis were performed in the field using parameter-specific electrodes.
11. Monitoring wells MW-1 through MW-8 were installed by Jacques Whitford Company, Inc. between January 14, 2002 and January 16, 2002.
12. Ethane, Ethene, 1,4-Dichlorobenzene and 1,2-Dichlorobenzene were detected at MW-1D during the June 2004 monitoring round at concentrations of 0.18 mg/L, 0.24 mg/L, 0.002 mg/L and 0.001 mg/L, respectively.
13. Chlorobenzene, 1,3-Dichlorobenzene, 1,4-Dichlorobenzene, and 1,2-Dichlorobenzene were detected at GZ-408 during the December monitoring round at concentrations of 0.0065 mg/L, 0.0051 mg/L, 0.023 mg/L, and 0.0025 mg/L respectively.
14. 1,2 Dichlorobenzene was detected in GZ-3A during the 8/7/2007 sampling round at a concentration of 0.0053 mg/L.
15. 1,1,2 Trichloroethene was detected during the 8/22/2007 sampling round in GZ-601U and GZ-606U at concentrations of 0.069 mg/L and 0.085 mg/L respectively.

TABLE 2D
WATER QUALITY SUMMARY TABLE - SOUTHERN SITE PORTION, UPPER UNIT

Site Name: Former Wastewater Treatment Facility
Site Town: Salem, New Hampshire

Groundwater Management Permit #: GWP-840533-5-002
(DES #: 840533)

Contaminant: **Total Organic Carbon (TOC), Sample Round No. 13.**
Chemical Oxygen Demand (COD), Subsequent Sample Rounds until Round No. 43. Data for that round respectively reflect COD and TOC concentrations.

	Round Number	Sample Date	Groundwater RCMP = NA

TABLE 2
WATER QUALITY SUMMARY TABLE

Site Name: Former Wastewater Treatment Facility — Groundwater Management Permit #: GWP-840533-S-002
Site Town: Salem, New Hampshire — (DES #: 840533)

Notes:

1. Sample Round Nos. 1 through 4, 6, and subsequent rounds were carried out by GZA GeoEnvironmental, Inc. (GZA) or Eastern Analytical, Inc. (EAI) on the dates indicated. Sample Round No. 5 was carried out by the New Hampshire Department of Environmental Services (NHDES) on the date indicated. Please refer to the analytical laboratory reports for additional information.
2. Concentration is in milligrams per liter (mg/L), which is equivalent to parts per million (ppm). Oxidation-reduction potential (ORP) is in millivolts (mV).
3. "<" indicates that the respective parameter was not detected above the reported practical quantification limit (PQL).
4. "≤" indicates that the respective parameter was detected, but below the reported PQL. "ND" indicates that the respective parameter was not detected above the PQL. "OR" indicates that the respective parameter was of range of the meter.
5. For the Chemical Oxygen Demand (COD)/Total Organic Carbon (TOC) table, where values for both parameters are available for a given sampling round, the COD value is provided first, followed by the TOC value (e.g., 520/180).
6. This table considers only those parameters that were analyzed for and detected. Please refer to current and past analytical laboratory reports for the complete list of analytes.
7. "RCMP" refers to NHDES Risk Characterization and Management Policy groundwater quality standards. The designations GW-1 and GW-2 are from the Method 1 Groundwater Standards. The more stringent value for either GW-1 or GW-2 was used as the standard. "SWQR" indicates Surface Water Quality Regulations. The more stringent of the two regulations (RCMP or SWQR) was used for surface water samples. "NA" indicates not available for respective parameter. Values in **bold** reflect exceedances of standards, or that the concentration was at the respective standard.
8. "NT" indicates respective parameter was not tested during the respective sample round. For the case of GZ-10L during Sample Round No. 7 and subsequent rounds, the reason was the destruction of this monitoring well. GZA attempted, but was unable to repair and sample this well during the July 1994 round, and then established monitoring well GZ-2L as a replacement sampling location. "NI" indicates monitoring well not installed on respective date.
9. Please note that methyl *tert*-butyl ether (M*t*BE) was detected, but below the PQL limit in a groundwater sample collected from monitoring well GZ-1L during Sample Round No. 9 and in a sample collected from surface water sampling location SW-6 at a concentration of 0.0068 ppm during Sample Round No. 13. Note: The RCMP standard for M*t*BE is 0.013 ppm. 1,4-dichlorobenzene (1,4-DCB) and 1,2-dichlorobenzene (1,2-DCB) were detected at concentrations of 0.0021 and 0.0053 ppm, respectively, in monitoring well GZ-3A during Sample Round No. 11. Note: The RCMP standard for 1,4-DCB and 1,2-DCB is 0.075 and 0.6 ppm, respectively.
10. Dissolved oxygen and ORP analysis were performed in the field using parameter-specific electrodes.
11. Monitoring wells MW-1 through MW-8 were installed by Jacques Whitford Company, Inc. between January 14, 2002 and January 16, 2002.
12. Ethane, Ethene, 1,4-Dichlorobenzene and 1,2-Dichlorobenzene were detected at MW-1D during the June 2004 monitoring round at concentrations of 0.18 mg/L, 0.24 mg/L, 0.002 mg/L and 0.001 mg/L, respectively.
13. Chlorobenzene, 1,3-Dichlorobenzene, 1,4-Dichlorobenzene, and 1,2-Dichlorobenzene were detected at GZ-408 during the December monitoring round at concentrations of 0.0065 mg/L, 0.0051 mg/L, 0.023 mg/L, and 0.0025 mg/L respectively.
14. 1,2 Dichlorobenzene was detected in GZ-3A during the 8/7/2007 sampling round at a concentration of 0.0053 mg/L.
15. 1,1,2 Trichloroethene was detected during the 8/22/2007 sampling round in GZ-601U and GZ-606U at concentrations of 0.069 mg/L and 0.085 mg/L respectively.

From "Remedial Action Plan Addendum," prepared by GZA, dated August 20, 2015
